*Includes numbered Basics from Weeks D28 (CPI) and D29 (EPI)

Arrangement of Abstracts

'MAJOR' COUNTRIES – An alerting abstract of every basic document is provided, and of examined equivalents from West Germany, Great Britain, Japan, the Netherlands and the United States, and granted and unexamined European and unexamined PCT equivalents. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

1981 INSTRUCTION CLASSES REGISTRATION FORM

A round of Derwent instruction classes, to be held during September, October and November 1981, will be of very special significance to both new *and* existing users.

The Syllabus of classes is as follows:

Elementary A Coding (IC2)	<i>A two day course for new users of CPI Section A codes, covering basic principles and discussion of examples. Max. 20 participants.</i>
Elementary BCE Coding (IC3)	<i>A two day course for new users of CPI Sections BC & E codes with special reference to the New Chemical Code, again with discussion of examples. Max. 20 participants.</i>
Advanced A Coding (IC4)	<i>A two day course for those with previous training and experience of the CPI Section A codes. Max. 20 participants.</i>
Advanced BCE Coding (IC5)	<i>A two day course for those with previous training and experience of CPI Sections BC & E codes, with special reference to the New Chemical Code and coverage of complex examples. Max. 20 participants.</i>
Online User Instruction and General Overview (IC6)	<i>A one day course giving in-depth treatment of all access points except special coding, together with formulation of strategy and "hands-on" experience. A general overview of Derwent and its Patents products will also be given. Max. 20 participants.</i>
Advanced Online Searching (IC7)	<i>A one day course demonstrating the use of special coding concepts and other parameters in the formulation of search logic to retrieve specific subjects or chemical structures. Max. 10 participants.</i>

Cost per person for these classes is: IC2 through IC5 £60 or \$130; IC6 and IC7 £40 or \$90.

D1: FOOD; FERMENTATION

D11: BAKING

PAIN/ ★ D11 60663 D/34 ★ DE 3004-787
Extrusion baking of bread - preceded by drying and/or roasting to reduce moisture content

PAIN JACQUET BISCOT 06.02.80-DE-004787
(13.08.81) A21d-13 A21d-15
06.02.80 as 004787 (39HM)

Conventional extrusion baking process is preceded by a drying and/or roasting operation for the material which has undergone the kneading, raising and baking stages. The drying and/or roasting operation has the purpose of reducing the moisture content in the material to be processed to bread from 35-38% to under 10%.

The first stage is a conventional process of preparing the usual raw materials of flour, water and additives by kneading, dough raising and baking. Drying and/or roasting to reduce the moisture content to under 10% and fine grinding precede the extrusion baking. Fresh flour can be added before the last stage at a rate of 20-40%. The best results were achieved by keeping the conditions directly ahead of the extrusion nozzle at 125-145 deg.C and 160-200 bar.

This turns the pale colour of extrusion baked bread into a golden brown and improves its aroma and pH value. (8pp)

SAAR/ ★ D11 D/34 ★ FI 7903-912

LAMB/ ★ D11 60807 D/34 ★ FR 2472-343
Distributing dough pieces into pockets of proving chamber conveyor - by pivoting tubular chute to gravity feed each pocket in turn

LAMBERT JC 27.11.79-FR-029611
(03.07.81) A21c-09/08

27.11.79 as 029611 (448HM)
Device is for distributing bread dough pieces into individual pockets of a conveyor of a bakery proving chamber. The device comprises a tubular chute through which each dough piece in turn is gravity-fed from a supply conveyor to a pocket of the proving chamber. Near its upper end, the chute is suspended from a pivot the horizontal axis of which intersects the axis of the chute at right angles. The chute is automatically swung about its pivot to discharge into each pocket in turn of a line of pockets across the proving conveyor, which is halted while each line is filled.

The feed conveyor is timed to deliver one dough piece for each angular position of the chute. The proving chamber conveyor is timed to advance an empty line of pockets beneath the chute each time the previous line is filled.

Pref. the pivotal axis of the chute lies in the median, longitudinal plane of the proving conveyor. Angular displacement of the chute is pref. effected by a reversible horizontal chain fitted with a peg which engages a slot in a plate integral with the chute.

Used for loading bread dough pieces into pockets of the conveyor of a bakery proving chamber. Transfers of dough pieces between balling up and proving stages is now fully mechanised to eliminate manual work. This is effected with an inexpensive yet reliable system which does not subject the dough to excessive working. (9pp)

BIED/ ★ D11 60808 D/34 ★ FR 2472-344
Struts assembled for supporting decorative foods e.g. cakes - opt. made from plastics components

BIEDERMANN H 13.11.79-FR-028640
P29 (03.07.81) A21d-13/08 A47j-43/20
13.11.79 as 028640 (515DJ)

A variable support for constructing pastry, cakes etc. into decorative forms comprises a set of struts which can be assembled by locating their ends respectively into a drilled block and a restraining hoop so that either set of ends may be carried on a supporting plate. The pastry etc. may be built up within or around the hollow array of struts.

A combination of a hollow block and a convoluted lining may be used instead of a drilled block to locate the struts. Claims include use of support components made of plastics materials. Compared with conventional sheet metal supports, the strut

dry out more rapidly. (4pp)

COXD. ★ D11 60879 D/34 ★ GB 2068-71
Movable rack for baking trays - top plate bolted to corner posts fitted on sheet metal base pegs
COX DENHOLM LTD 01.04.80-GB-C10863 (06.02.80-GB-004001)

P25 (19.08.81) A47b-47/02
01.04.80 as 010863 (1358AS)

A rack has a rectangular or square base of sheet metal with an upward peg at each corner received in the lower ends of posts, and a flat top plate bolted to the post tops. The base is pref. made by a single pressing and stamping operation, has a central rectangular or square window with downwardly turned peripheral flanges, and carries castors or rollers. The rack is inexpensive and easily disassembled for transport or storage. The window permits a good upward flow of hot air. (3pp)

BAKZ D11 63160 W/38 = J8 1031-930
Oxidizer compsn. for bread making

BAKER RES & DEV CORP 14.12.73-US-424785
E19 (24.07.81) *J50094-154 A21d-02/22 + A21d-08
13.12.74 as 144007 (DB)

A baker's oxidant, for use with a dough contg. flour, water and yeast, comprises a mixt. of potassium bromate powder and ascorbic acid powder in the form of capsules coated with an edible, water-insoluble substance of m.pt. at least 54.4 deg.C.

The use of ascorbic acid in place of the conventionally used iodate provides bread of at least as good quality. The ascorbic acid is safely coated with the insoluble substance while in a cold condition.

Pref. the coated powder consists of at least 50 wt.% particles of size 20-100 mesh. (J50094154) (6pp)

BRIN. ★ D11 61619 D/34 ★ NL 8000-030
Dough rolling machine has rotating rollers - on driven endless chains above conveyor movable to periodically interrupt roller contact

KONINKL BRINKERS MA 03.01.80-NL-000030
(03.08.81) A21c-03/02

03.01.80 as 000030 (1190BZ)

The arrangement intended for rolling out dough is fed by an extruder with a continuous thick layer to form a still coherent continuous layer of lesser thickness (d). The dough arrives on a conveyor assembly which passes it below a series of driven rollers whose distance to the conveyor surface successively reduce in the direction of movement whilst the rollers themselves move at a speed greater than that of the last part of the conveyor.

The contact between the rollers and the dough is intermittently interrupted for short period so that every part of the dough mass is given a number of opportunities to relax as it passes through the rolling station.

Preparation of dough by rolling out into thin coherent layer prior to further treatment. This process prevents over-stretching of the dough layer as its thickness is gradually reduced thus preventing breaks in the layer. It further permits the throughput to be varied between certain limits to adapt it to the demand from the following treatment station. (7pp)

OPTR. ★ D11 61627 D/34 ★ NL 8100-051
Deep-frozen gâteau is cut into central piece and sectors - then decorated and re-frozen for storage and distribution to point of sale

OPT ROOT MACH FAB 07.01.81-NL-000051
P62 (03.08.81) A21c-15/04 B26d-03/24

07.01.81 as 000041 (1190DJ)

The arrangement is intended for producing a pre-sliced gâteau (1) or the like consisting of layers built up in a round baking tin. The gâteau is deep-frozen and thereafter cut into slices by pressing a cutting head (7-9) through it which has a cylindrical (8) and radial cutters (7) such that it produces a cylindrical centre piece surrounded by a number of sector-shaped slices.

It is then taken out of the tin and decorated after which it is returned to deep-freeze temperature storage and held at that temp. until it reaches its final destination.

Used for prepn. of pre-sliced deep-frozen gâteaux for distribution to points of sale. This procedure avoids cutting after un-freezing at point of sale, which is labour-intensive, often leads

to unhygienic manual contact, produces un-equally sized slices and waste through crumbling of centre, and collapsing of pointed slice ends when served. Manually cutting in frozen form is practically impossible, and radially cutters meeting at the centre make the central portion unfit for serving. (9pp)

D12: MEAT; FISH PROCESSING

FIRM ★ D12 60488 D/34 ★ CH -623-996
Flavouring foods, etc., with pyrimidine derivs. - comprising 4-alkanoyl-pyrimidine cpds. and 2 methyl analogues
 FIRMENICH SA 20.12.77-CH-015735
 E13 (15.07.81) A231-01/22

20.12.77 as 015735 (367WB)
 The flavour and aroma of human and animal foods, drinks, pharmaceuticals and tobacco are reinforced, improved or modified by adding pyrimidine derivs. of formula (I): (where R₁ is H or Me and R₂ is 1-6C alkyl, provided that R₁ and R₂ are not both Me).

(I) can be added in amts. of 0.02-20 ppm, opt. in the form of a soln., e.g., in EtOH, dipropylene glycol or triacetin. (I) can be prepd. by standard methods, e.g. by reacting the corresp. 2-R₁-4-cyanopyrimidine with R₂MgX (where X = halogen).

(I) are esp. useful for flavouring meat, meat-based foods and meat substitutes, to which they impart, inter alia, roasted or grilled meat or fat notes. (5pp)

DEAK ★ D12 60503 D/34 ★ DD -148-437
Protein hydrolysate prodn. from fish - by enzymatic hydrolysis after successive acid, alkali and alcohol pretreatment
 AKAD WISSENSCHAFT DDR 15.11.79-DD-216915
 (27.05.81) A23j-01/04 A23j-03
 15.11.79 as 216915 (367HM)

Prod. of protein hydrolysates comprises (a) treating fish (esp. shark) flesh with an acid; (b) treating the solids from (a) with an alkali; (c) extracting the solids from (b) with an alcohol; and (d) hydrolysing the solids from (c) with a protease (esp. thermitase).

Step (a) is pref. effected with a 2- to 5-fold (esp. 3- to 4-fold) amt. of 0.05-1 (esp. 0.1-0.25)% H₃PO₄ at 50-70 (asp. 60) deg.C for 1-5 (esp. 2-4) hr with stirring, followed by centrifugation. Step (b) is pref. effected with 0.01-1 (esp. 0.05-0.1)% ethanolic NaOH at room temp. for 0.5-5 (esp. 1-3) hr, followed by centrifugation. Step (c) is pref. effected by extn. with ethanol at 30-60 (esp. 40-50) deg.C for 10-60 (esp. 15-45) min, the extn. being performed 1-3 (esp. 2) times.

The prods are white to pale-cream in colour, are odorless, have a neutral (non-bitter) taste, and are suitable for use in foodstuffs and dietary supplements. (10pp)

TOUR/ ★ D12 60809 D/34 ★ FR 2472-345
Prepn. of hooved animal leg for de-boning - with machine which automatically trims spurs, removes nail and slits open leg
 TOURNIER C 20.07.79-FR-019248
 (03.07.81) A22c-17
 20.07.79 as 019248 (448BZ)

The machine has successive operational stages of (1) a cutoff station where the two side spurs are trimmed from the leg. (2) a nail removal station where the nail is eliminated from the hoof (3) a slotting station where a saw cut is opened up between cartilage and bone.

The cutoff station is equipped with a power clamp to grip the leg during spur removal and then as the leg is advanced towards the other operational stations. The three operational stations are pref. active in approximately the same horizontal plane.

The power clamp is pref. actuated by hydraulic cylinder(s). The cutoff station pref. comprises a hydraulically displaceable blade mounted in a carriage housing the power clamp. The carriage can carry the trimmed leg towards the nail removal station, which is also actuated by hydraulic cylinder(s). The sequence of

programmed controller.

Saving of time and labour by mechanisation of tasks previously undertaken by hand. (15)

NUTR- ★ D12 D/34 ★ RO -76-326
Animal protein hydrolysate prepn. - by boiling comminuted animal protein and water, adding poultry viscera, acidifying and heating
 INST NUTRIT ANIMALA 06.10.76-RO-087919
 (30.03.81) A23k-01/10

KEME = ★ D12 61654 D/34 ★ SU -782-867
Meat mincer disc grid - has tubular elements placed in disc made as bearing element and collar
 KEMER MEAT DAIRY IN 26.02.79-SU-731378
 P41 (30.11.80) B02c-18/30

26.02.79 as 731378 (110GW)

The meat grinding grid is made as a constant thickness disc with through-openings. In order to improve mincing process efficiency, the grid is formed by tubular elements (3). The disc consists of bearing ring (1) and collar (2). The tubular elements are placed between the bearing ring and the collar. The collar is made with brackets (4) and is tightened by bolts (5). Thus the prod. is pushed through the tubular elements and through the inter-tubular space, hence improving the mincing efficiency. Bul. 44/30.11.80 (2pp Dwg.No.1).

KDPO = ★ D12 61966 D/34 ★ SU -785-705
Unit for controlling moisture content of food prods. - has spring-loaded beam with weight-receiver and compensating weight actuated by a double-thread lead-screw

KRASD POLY(SEAF =) 05.12.78-SU-693124
 S03 X25 (07.12.80) G01n-25/56

05.12.78 as 693124 (29GW)

Device is used for controlling the moisture-content of food products during drying processes, and during cold smoking of meat and fish products has spring-loaded beam (1), weight-receiving attachment, balancing weights (13) and dial (19) with pointer. Control precision is increased by fitting the beam with guides (7) and lead screw (9) having left and right threads, and a displacement-analogue signal converter (18). The weight-

receiving attachment (12) is placed on one of the threads of the screw using a nut surrounded by a guide, with the balancing weight (13) on the other thread and guide. The lead-screw is parallel to the beam. Bul.45/7.12.80 (2pp Dwg.No.1)

MOMD ★ D12 61979 D/34 ★ SU-786-956
Meat and bone separator - has concn. table onto which ground-up frozen particles are spread, subjected to air flow and vibration, and collected in hoppers and on drum

MOSCOW MEAT DAIRY INST 02.02.79-SU-723143
(25.12.80) A22c-17/04 A22c-29/02

02.02.79 as 723143 (29GW)

Device for separating meat from bones, during the prodn. of sausages, cutlets, meat dumplings etc., with the simultaneous prodn. of ground bone, has concn. table (2) for the preliminary sepn. of the meat and bone mixt. according to size. Productivity is increased by adding a drum (7) underneath the table, which has several rows of brushes (8-11), plus an attachment (12) for thawing out the surface layer located inside the drum. The table has unloading hoppers (3-6), while the brushes in the different rows have varying degrees of rigidity and thickness; they are collected into groups so that the brushes having a particular characteristics are associated with the respective hopper. (3pp Dwg.No.1)

MOMD ★ D12 61980 D/34 ★ SU-786-957
Separator for meat and bone, e.g. of fish - by grinding extremely finely during freezing, and feeding to perforated, vibrating deck with ionised air flow

MOSCOW MEAT DAIRY INST 09.02.79-SU-725819
X25 (25.12.80) A22c-17/04 A22c-29/02

09.02.79 as 725819 (29GW)

Equipment to divide meat-bone raw materials into fractions (e.g., the sepn. of fish into their component parts), has concentration table with perforated deck (2) fitted at an angle, so that it slopes and can be moved backwards and forwards by the mechanism (5) in the horizontal plane, plus a fan (6) for supplying air. The sepn. is speeded up, with prevention of particles of bone falling into the meat fraction, by adding corona electrodes (3) and an air ioniser (7); the latter is placed under the deck on the delivery pipe from the fan. The deck and the pipe are earthed. Bul.46/15.12.80 (2pp Dwg.No.1)

TEKH= ★ D12 61981 D/34 ★ SU-786-958
Unit for moving fish along cassettes of conveying unit - has pusher rod and cam mechanism connected to spring-loaded arms mounted on pivots at right angles

TEKHRYBPROM COMBINE 10.01.79-SU-711879
(15.12.80) A22c-25/08

10.01.79 as 711879 (29GW)

Device for moving fish along a cassette in a conveying unit of a treatment machine, e.g. for holding the fish whilst its tail fins are cut off, has spring-loaded pusher rod driven by the motion of a cam. The fish are moved during continuous conveying, with increased safety in the movement, by mounting the pusher-rod on two mutually-connected spring-loaded arms, the rocking axes of which are located at right angles to one another. The pivot of the arm on which the pusher-rod is directly fastened is parallel to the direction in which the fish are moving. (3pp)

SEVT= ★ D12 61982 D/34 ★ SU-786-959
Device for orientating fish in one direction - has conveyor above which are centring flaps and transverse drum against which fish presses to operate receiving plate which slopes upwards

SEVTEKHRYBPROM COMB 15.02.79-SU-729556
(25.12.80) A22c-25/12

15.02.79 as 729556 (29GW)

Fish-orienting device, which directs them all in the same direction, has conveyor (1), spring-loaded flaps (2) and rotating drum (3). Orientation reliability is increased, and the range of fish that can be oriented is greatly extended, by connecting the drum (3) to one of the rollers of the conveyor (1) and making it possible for it to rotate in three planes; the equipment is fitted with a plate (6) which rests against the drum and is linked to it, mounted so that it can be inclined in a direction opposite to that in which the drum is rotating. (4pp Dwg.No.1)

Mixing fish and salting mixt. with economy of latter - by rotating container backwards and forwards while pressing fish down to obtain better packing

KLAIPEDA ZAPRYBA 28.06.77-SU-502332
(15.12.80) A23b-04/02

28.06.77 as 502332 (29GW)

Method for making salted fish products involves proportionating the fish and a salting mixture, feeding them into containers and pressing down. The quality of the finished prod. is increased, with economy of salting mixt., by giving the containers a circular reciprocating motion during the pressing operation, using a speed of 400-1000 r.p.m. with a rotational radius of from 2 to 20 mm, in order to mix and orient the fish as they are packed with the salting mixt. (3pp Dwg.No.1)

Smoking equipment for food prods., e.g. fish or meat stuffing - has mixing chamber with hollow shaft and mixing blades through which prod. is satd. with smoke

AZOV BLACK SEA FISH 23.02.79-SU-730010
(25.12.80) A23b-04/04

23.02.79 as 730010 (29GW)

Equipment for smoking food prods., e.g. in the form of meat of fish stuffing, has a chamber (4), mixer made of shaft (7) bearing the blades (6), and pipes to admit and withdraw the product being processed. The final quality of the prod. is increased by more completely saturating the material with smoke. This is achieved by making the shaft (7) and the blades (6) hollow. The blades are also fitted with holes to let the smoke come out. The blades are

triangular in shape, with their apexes facing towards the direction of rotation; this creates the suction required to draw the smoke through. (4pp Dwg.No.1.)

Shrimp stripping machine - in which shrimps are fed on a needled wheel past various operating knives

HOFFMAN PH 08.05.79-US-037396

(04.08.81) A22c-29/02

08.05.79 as 037396 (525NS)

In a shrimp stripping machine, shrimps are fed by a feed device which ensures correct orientation of the shrimps, past a serrated cutting wheel which slits the abdominal shell whilst disrupting the suiminerets and the interconnecting tissue. The slit shrimps are impaled by the needles of a first wheel and under the guidance of a curved blade are passed under a cutting blade which cuts at least the first five shell segments and which removes the vein. A vacuum duct acts to suck out the shell pieces etc. cut from the shrimps and to convey the shrimps onto the first wheel. Finally the shrimps are given a butterfly cut by a spring biased blade and are transferred to a second needled wheel for removal. Final remnants of shrimp are removed through a second duct.

The machine is fast and reliable and the shrimp is correctly ovented. (9pp)

Producing butter-fat by removing water and protein from butter - using microwave heating followed by multistage decantation

ENTREMONT SA 21.01.81-FR-001073 (29.04.80-FR-010117)

(31.07.81) A23c B01d

01.04.81 as 888232 (448KB)

A shallow stream of melted butter is run in laminar flow through a channel where it is fully penetrated by microwave irradiation, pref. at a frequency of 2.45 GHz. The energy imparted to the butter is controlled to limit the rise in temp. to several deg.C only, pref. not more than 6 deg.C. This irradiation results in the butter fat floating on top of a layer of proteins and water. Sepn. by decanting is effected in at least two, pref. three, successive stages.

The irradiation channel is pref. made of a material which is permeable to the microwaves, esp. PTFE, and is housed in a casing of material which is impermeable to microwaves, partic. stainless steel. Temp.-rise due to irradiation is pref. detected by sensors at the inlet and outlet of the channel. Their signals can control the energy supplied by the microwaves.

Used in prodn. of a virtually anhydrous butter fat exempt of proteins. This is a prod. which can be stored for long periods without refrigeration, simply by excluding oxygen. (20pp)

The composite agent, which is non-absorbable and non-nutritive, comprises an active flavouring agent (I) covalently bonded to a cpd (II) to give a non-metabolisable, non-absorbable product

preventing the passage, of (I) through the mucous of the gastrointestinal tract. Toxicity, secondary effect and calorific effects due to (I) are thus prevented. (II) is pref. a hydrophilic polymer of mol.wt. 2500-250000. (J49100266) (12pp)

BIDE-★ D13 61618 D/34 ★NL 8000-015
Peeling potatoes and other tubers - by erosion of the skin with a gas stream contg. ice particles
BIDE ECO BV 03.01.80-NL-000015
P28 (03.08.81) A23n-07/02 A47j-17/14
03.01.80 as 000015 (513DJ)

In a process for removing the skin from vegetable tubers, esp. potatoes, the skin is eroded away using a gas stream, esp. an air stream, contg. a distribution of ice particles. Pref. the ice is formed on a wetted, rotating cooled cylinder and the resulting ice is scraped off and mixed with the gas stream, opt. after comminution. Pref. the water used to make the ice contains ca. 0.1% of salt, esp. NaCl.

In another embodiment, the water used for making the ice particles is cooled under press. to below 0 deg.C and injected into the gas stream, which is pref. at below 0 deg.C to form the ice particles in situ. Pref. the gas stream is at or above 0 deg.C when it contacts the vegetables. The vegetables to be peeled are pref. mounted on rotating axes which move to and fro whilst the peeling process is being carried out.

Process allows peeling of potatoes and other tubers with minimum wastage, low consumption of water, and without using chemicals such as caustic soda, which spoil the appearance of the vegetables. (7pp)

A biologically active product is obtained by (a) collecting bee drone larvae together with their comb cells on the 10th day after laying of the non-fertilised eggs, (b) homogenising the larvae and comb cells, (c) filtering the mixt., and opt. (d) freeze drying the product. The whole process must be carried out under sterile conditions.

The product is an off-white milky fluid with a cream-like taste having a pH of 4.8-6.7, a moisture content of 65-80 wt.%, a total protein content of 10-20 wt.%, a total sugar content of 1.00-5.50 wt.%, a total lipid content of 5.00-6.30 wt.% and an ash content of 1.00-1.50 wt.%. It contains 1.0-1.3 wt.% free amino acids. Vitamins present include vitamin A, beta-carotene, xanthophyll, vitamin B2, nicotinic acid and choline.

The product contains proteins, sugars, lipids, amino acids, mineral salts, vitamins and hormone-like substances derived from the larval sexual structures. It can be used for human nutrition, as a stimulant in apiculture (giving increased yields of royal jelly), in cosmetic skin-care compsns. and as a poultry feed additive. (8pp)

Strand forming device for sweet-meat paste - with rectangular grooves and collars in pair of rolls
 SOLLICH & CO GMBH 05.02.80-DE-004022
 (13.08.81) A23g-03/06

A device for forming strands of sweetmeat paste is a pair of grooved rolls. Each pair has several grooves, separated by collars. The collars of the one enter the grooves of the other roll, leaving a rectangular gap for the sweetmeat strand. The sides of the collars act as shearing faces for the sweetmeat paste.

Two rolls on drive shafts have grooves and collars which

engage with each other and separate the sweetmeat paste into several strands. Scrapers enter the grooves and deposit these strands on an endless conveyor.

This creates a continuous production of several strands of clean shape which are ideal for further processing and have a uniform density. (14pp)

USSU ★ D14 60737 D/34 ★ EP --33-549
Drying aromatiser-contg. liq. or paste prodn. - having density and/or viscosity such as to cause protective skin-formation on carrier

HAG AG 05.02.80-DE-004162
+ Q76 (12.08.81) A23f-05/28 A23l-01/22 A23l-02/08 F26b-07
05.02.81 as 100827 (200KB) (G) No-Citns. E(AT BE CH FR GB LI NL)

In drying liq. or paste prods. contg. volatile or heat-sensitive aromatising materials, a thin prod. layer is applied to a carrier and the prod. layer is dried. In order to form a skin at the start of drying, prod. density and/or viscosity are such that layer movement relative to carrier is prevented during drying.

The examples refer to coffee extract and fruit juice concentrate. The skin prevents aromatising material escape. The aromatising materials are retained completely and unchanged in dried prod. (8pp)

CARD/ ★ D14 60845 D/34 ★ FR 2472-741
Indicator to reveal temp. rise of refrigerated prod. - esp. frozen food uses indicator material which melts at critical temp.

CARDON J P 28.12.79-FR-032168
S03 X27 (S02) (03.07.81) A23l-03/36 G01k-11/06
28.12.79 as 032168 (HM)

Indicator shows if the temp. of a prod. in refrigerated storage has exceeded a predetermined value, even when the temp. has returned to a temp. below that value. The indicating material is held in a container inside which the material changes state as the temp. rises above a critical value. The indicator can be fitted to the prod. package or in the storage cabinet. The indicator material changes from solid to liq. as the temp. rises above the critical value, and vice versa.

The container has a compartment which serves as a mould in which the indicator material is frozen to a definite shape. In operation the indicator container allows the melting material to flow into another compartment so that if refreezing takes place the temp. rise remains obvious.

The container can be made of transparent material so that the change of shape is visible. Alternatively, or in addn. the container can be made of flexible material so that change of shape distorts the container.

Used to indicate that a prod. in cold storage has undergone an unwanted temp. rise. In partic. that frozen food has been subjected to unsafe temp. conditions. The indicator change is irreversible, reproducible and provided with sufficient inertia to ignore brief exposure to ambient temp.. The indicator is reliable, small and inexpensive. (15pp)

Bag contg. oxygen absorbent - comprise laminate with gas permeable sheet e.g. paper laminated to one or both sides of a microporous film

MITSUBISHI GAS CHEM IND 26.06.80-JP-U89576 (21.12.79-JP-V77432)

Q34 (19.08.81) B65d-65/40
19.12.80 as 040874 (1494AT)

The bag in which oxygen absorbent is sealed has at least part of the material comprising a bag made of a laminate. In the laminate a gas permeable sheet such as paper, cloth, non woven fabric, is laminated to one or both sides of a microporous film. The layer having the lower softening point constitutes the inner surface of the bag, and this may be either the gas permeable sheet or the microporous film.

The microporous film may have a fine openings of dia. 0.01-50.00 microns or they may be elongate with a width of 2 microns. The bag may opt. comprise a gas permeable sheet laminated to one side of the microporous film, which film is coated on the other side with a hot melt adhesive.

The laminated sheet comprising the bag is water impermeable so the bag can be packed with liquid or semi-liquid foodstuffs. The bag is heat sealable at speed and of sufficient strength. (5pp)

Vibrating screen particle classifier - having discharge opening adjustable in size in accordance with any change in shape of particle fraction being removed

CARTER L M MFG CO I 10.10.79-US-083412
P41 (04.08.81) B03b-04

10.10.79 as 083412 (525NP)

A device for separating particles into fractions of different sizes, one of which is the desired size, includes a vibrating screen on which a bed of fluidised particles is maintained by pressurised air blowing up through the screen. Discharge openings are formed at the sides of the screen for the particles in the desired size range, those below that range, and those above it. The opening for particles in the desired range is defined by a closure member, the position of which is movable to elongate and under the opening in accordance with an increase in air pressure through the screen. An increase in the air pressure causes a change in the shape of the mass of particles in the desired change range, which change in shape is minored by the change in shape of the opening.

By altering the opening in accordance with the change in shape

of the particulate mass, most of the particles in the mass can flow through the opening; rendering the device more efficient. (22pp)

D15: WATER TREATMENT

CELA ★ D15 60442 D/34 ★ BE -887-390
Continuous treatment of effluent water contg. organic impurities - by passage through fabric filter loaded with biomass in closed container, withdrawing gas, and liq. streams, and recycling treated liq.

CELANESE CORP 06.02.80-US-118935
(05.08.81) C02f-03/28

05.02.81 as 887396 (513RH)

Continuous biological degradation of organic contaminants (I) in a stream of effluent water comprises contact with a biomass of microorganisms on a support. The process is carried out in the absence of added oxygen using microorganisms (II) capable of degrading the (I) into CO₂ and other prods. The process comprises (a) continuously passing the effluent stream and a recycle stream downwards through a restricted opening into a sealed vessel, the restricted entrance being filled with a fabric carrying a surface layer of the (II). The vessel is sealed against the entry of air and other sources of O₂.

During the passage of the effluent in intimate contact with the (II) in the restricted part of the entrance, at least part of the (I) is degraded into CO₂ and other materials. The CO₂ rises out of the restricted entrance section to the vessel in counterflow with the incoming effluent stream. The temp. is maintained at 10-60 deg.C to facilitate the biological degradation process at atmospheric pressure; (b) continuously withdrawing CO₂ and other gaseous prods. from a point above the restricted section, at the top of the sealed vessel; (c) continuously withdrawing the effluent liq. from the lower end of the sealed vessel at a point below the restricted section, and at a rate such that the liq. level in the vessel is maintained below the restricted section; and (d) continuously discharging part of the effluent withdrawn and recycling part to the input to the vessel with the incoming effluent, in an amt. so as to maintain the concn. of pollutants having a bactericidal or bacteriostatic action below the concn. at which they inhibit growth of the (II). Deodorising treatment for pig excrement - by adding lime, settling, then sepg. liq. and solid fractions, both useful as fertilizer

DELAUNAY J P 17.04.78-FR-011170
C04 (12.08.81) *EP--5-113 C05f-03
13.04.79 as 400246 (448AT) (F) FR2020516 FR2371399 NL6902007 E(BE DE GB NL)

A process and an installation for deodorising pigs' liq. manure where it is converted for use as agricultural fertiliser. A calcareous agent is added to the manure, the mixt. is decanted and the liq. fraction oxygenated with an air blower.

The agent, pref. calcium carbonate, is added at a rate of 100 kg. per 12 cubic m of manure. After decanting the mixt. for 3 to 5 days, the liq. fraction is oxygenated to evaporate 40 per cent of its initial vol. Meanwhile, the solid fraction is left to stand on a storage area. Both fractions can then be used as fertiliser. (7pp)

04.02.80 as 300320 (295DH) (E) GB1400723 US3148509 US4169873 E(CH DE FR GB IT)

Circulation is produced within a body of liq. using a device which includes a vertical stack pipe wholly submerged in the liq., a large bubble generator, and a vertical stand pipe. The bubble generator includes a gas accumulator chamber whose upper portion is connected by an inverted siphon to the stand pipe.

A transverse gas flow conduit connects the upper end of the stand pipe and the stack pipe. This is connected through the peripheral wall of the stack pipe. There is a sec. liq. inlet into this transverse conduit.

The device is used for the agitation of large standing bodies of liq., e.g. in anaerobic sewage systems. (21pp)

Controlling liq. level in evaporation compartments - of multistage expansion evaporator using circulation conduit between discharge chamber and evaporation compartment

ESMIL BV 05.02.80-NL-000704
J01 (12.08.81) B01d-01/26 B01d-03/06 C02f-01/06
29.01.81 as 200121 (1044BZ) (E) E(DE FR GB IT)

A multistage expansion evaporator has a series of stages each comprising an evaporation chamber and a heat exchanger chamber in open communication with each other. A heat exchanger conduit extends through the heat exchanger chambers. A circulation conduit connects a discharge chamber to one of the evaporation compartments in the second half of the evaporator and has a control valve to permit control of the liq. level in the evaporation compartment.

Excessive levels in certain evaporation compartments can be avoided by conveying part of the water through the circulation conduit so that the remaining quantity of feed water still flowing through the compartments does not produce an excessive level in them. Adjustable throttle openings in the partition walls are no

evaporation compartments. (17pp)

23.01.81 as 400092 (448HM) (F) FR2195476 FR2023739 FR2022818 FR2187400 US3653641 E(AT BE CH DE GB IT LI NL SE)

Aerator for liqs. has a pump at least partly immersed below the surface of liq. in a tank etc. The pump is located between an upwardly convergent suction bell, below the pump, and an upwardly divergent spray discharge nozzle above it, close to the surface.

The installation now comprises a suction bell close to the bottom of the tank. The suction bell is connected to the discharge nozzle by a riser pipe of which the length is adapted to suit the depth of liq. in the tank. The pump is fully immersed inside or in the vicinity of the junction bell.

Pref. the pump is housed in a secondary suction bell installed coaxially within the first. Liq. flowing up through the pump and secondary suction bell entrains an upflow of liq. via. the annular passage between the two suction bells.

The installation can be fitted to a float chamber to rise and fall with the surface level of liq. in the tanks.

Used in aeration of liq. partic. for the purificn. of waste water. Liq. is sprayed up from a much greater depth than is common with previous, surface aerator. Pump efficiency is raised by providing by providing an adequate back pressure at the pump outlet, which is now well below the surface of liq. (14pp)

Determin. of water hardness by ion exchange resin - by monitoring the swelling and contraction of the resin according to dissolved ion species and concn.

DOJIN KAGAKU KENKYU 07.12.79-JP-159472

A91 (03.07.81) G01n-33/18

07.12.79 as 159472 (50BZ)

A method for determining hardness of water comprises an ion exchange resin, formed by imparting ion-exchange group (e.g. sulphonic acid group) to high polymer matrix with controlled crosslinking degree (e.g. styrene-divinylbenzene copolymer); the resin exhibits different degree of swelling according to the kind of adsorbed ion as the measure of water hardness. An appts. for determining water hardness comprises using the swelling and contracting phenomenon shown by the resin as the measure of water hardness.

The ion-exchange resin contracts when sample water passes contains alkaline earth metal ion and swells when sample water contains hydrogen ion or alkali metal ion, and the change in the volume of the resin between them is visibly large. Also the response speed of the volume change is large.

The method and the apparatus are very useful for monitoring the life of ion-exchange activity of the apparatus for softening hard water. (3pp)

NIPA ★ D15 61257 D/34 ★ J5 6082-31
Treating aq. cationic paint waste water - by mixing with coagulant, clay, auxiliary alkaline coagulant and burning out by adding a fuel etc.

NIPPON PAINT KK 10.12.79-JP-160641

Q73 (06.07.81) C02f-01/52 F23g-07/04

10.12.79 as 160641 (117RH)

Aq. cationic paint waste water contg. 5-20 wt. solids is treated by mixing with 0.4-1.6 wt.% (based on solid content) of a coagulant, e.g. Al sulphate, Al polychloride, etc., and 0.2-1.0 wt.% (based on solid content) of an auxiliary alkaline coagulant, e.g. NaOH, etc., and burning out by adding a fuel etc.

quick lime, caustic soda, lime stone, etc., in an amt. sufficient to make the pH of the mixt. 8.0-11.0, and then the obt'd. mixt. in a slurry is burned out by the addn. of a fuel, e.g., heavy oil, kerosine, waste oil, etc.

Method cures the cleaning maintenance of slurry storage tank and the transportation of the slurry of cation paint waste water easier because no settlement of solids occurs in the tank and also no blocking occurs during the transportation through pipe, etc. In addition, the slurry can be easily mixed with the other waste water, and also can be easily burned out or disposed of at dumping site as required. (3pp)

HITA ★ D15 61483 D/34 ★ J5 6084-320
Desorption of uranium from adsorbent - by contacting with phosphoric acid soln., esp. for recovering uranium from sea-water

HITACHI KK 14.12.79-JP-161504
E31 J01 M25 (09.07.81) B01d-15 B01j-20/34 C01g-43 C22b-60/02
14.12.79 as 161504 (42RP)

Uranium (I) adsorbed by an adsorbent (II) is desorbed by contact of (II) with phosphoric acid (III) soln. (II) adsorbing (I) should be contacted with (III)-soln. of 0.01-5 ml/l conc. at room temp. -50 deg. C.

The method relates to desorption of (I) from (II), which adsorbs (I) from sea water. (I) in sea water has been collected most effectively with use of such (II) as hydrous Ti oxide or Ti-Fe adsorbent. For desorption of (I) from (II), (II) is contacted with carbonate or acid soln. However, when (II) is contacted with carbonate, Ca carbonate, formed by the reaction between the carbonate and Ca adsorbed in (II) from sea water, deposits on the surface of (II), lowering the adsorption activity of (II). Acid dissolves (II) and damages the adsorption activity of (II). The present method desorbs (I) effectively without causing the above mentioned problems. (2pp)

Purificn. industrial waste water - includes filtration through wood shavings, then polyurethane foam to improve removal of polychlorinated phenyl-benzene cpds.

NOVOS ENG CONS INST 06.06.78-SU-627673

A88 E14 J01 (07.12.80) C02f-01/58

06.06.78 as 627673 (835VE)

Polychlorophenyl benzene cpds. (I) are removed from effluent by settling and filtration, by two-stage filtration through wood shavings followed by polyurethane foam. Effluent contg. oil, (I) and mechanical impurities totalling 10 mg/l, is firstly filtered through wood shavings. 1 g. of the latter removes 0.48 g. of suspended (I). Further filtration through polyurethane foam is carried out to remove soluble (I) by absorption on the foam. 1 g. of the latter absorbs 3.4 g. dissolved (I). Bul. 45/7.12.80 (2pp)

UYKI = ★ D15 61746 D/34 ★ SU-785-220
Removal of alkaline earth metal cpds. from effluent - by two-stage deposition using sodium sulphate then carbonate, to improve strontium removal

KIEV UNIV 26.04.79-SU-759418

E33 M14 (10.12.80) C02f-01/58

26.04.79 as 759418 (835VE)

Effluent contg. alkaline earth metals is treated with Na_2CO_3 and filtered to remove the former. If Sr is present, it is more readily removed by preliminary treatment with alkali and a soluble sulphate. The method can be used in non-ferrous metal treatment plants and chemicals mfr.

Typically, effluent from iodine-Br mfg. plants contg. (g/l): Ca 10, Mg 2, Na 50, K 5, HCl 0.4, Sr 0.5 is treated with 8.9 g/l $\text{Ca}(\text{OH})_2$ to pH 11. There are then added 143 g. $\text{Na}_2\text{SO}_4 \cdot 10 \text{H}_2\text{O}$ which precipitates much of the Ca and 75% of the Sr. The clear supernatant liquor after standing is treated with 4.5 g. Na_2CO_3 per l. After settling for 48 hrs., the Sr content falls to 3 mg/l which is an acceptable norm. The above procedure reduces the Sr content of effluent to 0.6% and Ca to 0.2%; simultaneously expenditure of Na_2CO_3 is reduced from 40 to 4.5 g/l. Bul. 45/7.12.80 (2pp)

PLOT/ ★ D15 61747 D/34 ★ SU-785-221
Neutralisation of acidic metal ions contg. aq. effluent - by addn. of soda followed by electrolysis with steel electrodes to avoid excess salt build-up

20.11.79 as 096177 (920HM)

In the hot water process for the extn. of bitumen from tar sands, where a solids-laden aq. whole tailings stream contg. coarse and

fine solids) is obtained as a waste prod. the improvement comprises (a) treating the tailings stream with a flocculating agent (I) to flocculate both coarse and fine solids and produce settled aggregates, (b) simultaneously monitoring the zeta potential of the fine solids left in suspension, (c) continuing addition of (I) until the zeta potential becomes zero, and simultaneously (d) separating the constituents of the stream to produce a water-free solids phase and a clarified aq. phase.

The control of flocculant dosage optimises filtration, leading to rapid filtration rates, low cake moisture and low solids level in the filtrate. (7pp)

Water treatment esp. for swimming pools - comprises adding ascorbic acid to chlorinated water to destroy carcinogens

PACINI A J 22.02.77-US-770445 (16.07.75-US-596368)

E13 (E32) (04.08.81) C02f-01/76

22.02.77 as 770445 (985RH)

Water treatment comprises (i) adding chlorine to a concn. in excess of that required to sanitise the water supply and (ii) adding ascorbic acid to inactivate the excess chlorine. The concn. of the ascorbic acid is sufficient to destroy existing carcinogens and prevent the formation of carcinogens while leaving a residual free chlorine concn. in the water supply sufficient to sanitise the water. Pref. copper sulphate is also added to catalyse the inactivation of the chlorine by the ascorbic acid. The concn. of the copper sulphate is pref. 1.5% of the concn. of the ascorbic acid required in the absence of copper sulphate; and this reduces the required ascorbic acid concn. by 75%.

The treatment is esp. for swimming pool water. (6pp)

Immunological determination of antibodies, antigens and
hapten(s) - by immobilising one component on a water insol.
carrier and then incubating with a component that combines with
the first component

MERCK PATENT GMBH 02.02.80-DE-003836

A96 B04 S03 (12.08.81) G01n-33/54

10.01.81 as 190141 (140AT) (G) DE2951678 DE3003301 DE2852373

The determination of a component in a gp. consisting of specifically combined receptors (I) and substances (II) which can be specifically fixed by these receptors comprises incubating one of these components after immobilisation on a water insol. carrier with the other component. After conventional washing the mixt. is then incubated with an enzyme fixed on saccharide and the enzyme activity determined.

The enzyme fixed to saccharide is pref. one with lectin properties or is lectin with enzymatic activity, esp. galactoseoxidase, galactosidase and/or mannosidase. The immobilised component (I) is pref. a modified component in which the saccharide gp. is altered so that it cannot fix any more saccharide fixing enzymes and/or lectin. The two components (I) and (II) are either simultaneously or successively incubated with the coupling prod. of component (II) and a saccharide contg. molecule. The water-insoluble carrier is pref. a plastics container, esp. a polystyrene or polypropylene test tube.

The process can be used in the immunological determination of antibodies antigens and haptens in soln., using the effect of enzyme activity. The process is more exact and rapid than previous enzymeimmunoassays. The enzyme need not be modified. (30pp)

Bacterial prepn. for prophylaxis of poultry intestinal disturbance - esp. salmonella infections, prepd. by anaerobic cultivation of normal alimentary tract bacteria having high adhesion to epithelial cells

NURMIE V 11.01.80-FI-000077

B04 C03 (12.08.81) A61k-35/74 C12n-01/20

08.01.81 as 300077 (949BZ) (E) No-Citns. E(AT BE CH DE FR GB IT LI NL SE)

Prodn of a bacterial prepn for the prophylaxis of poultry intestinal disturbances comprises anaerobically cultivating, opt together, strains of normal alimentary tract bacterial spp having an adhesion efficiency onto poultry alimentary tract epithelial cells of at least 10 bacteria per cell, followed by isolating the cultivated bacteria. Pref cultivation is in presence of the epithelial cells.

Pref 4-8 different bacterial strains are cultivated, esp together. Pref bacterial strains are Lactobacilli or both Lactobacillus and Clostridium spp., partic one or more Lactobacillus fermentum, L.lactis, L.acidophilus or Clostridium sp. strains.

Esp useful for inhibition of salmonella infections in poultry by normalisation of the intestinal flora in young chicks (see eg Nurim and Rantala, Nature, 241, 210-211, 1973). Process is much less expensive than bacteriological monitoring of feedstuffs, avoids the undesirable use of antibiotics and chemotherapeutics and the use of pure strains of bacteria avoids infection with pathogenic viruses, bacteria or parasites, c.f use of cultures obtd from the intestines of mature fowl. An improvement in health and faster growth are also observed. (17pp)

28.01.81 as 300337 (387KB) (E) No-Citns. E(CH DE FR GB IT LI)

A new antihaemolytic substance M-9337 (I) is produced by

culturing a (I)-producing strain of the genus Streptomyces esp. the new strain S. antihaemolyticus FERM-P 4651. (I) is a neutral substance (pH 6-7 at 1 mg/ml) having a m.pt. of 170-175 deg.C (decomp.). Elementary analysis shows 52-53% C, 7-8% H, 39-41% N. It is soluble in DMSO and CHCl₃/MeOH, slightly soluble in water and MeOH, and insoluble in EtOAc and CHCl₃. It gives positive colour reactions with anthrone, iodine, NH₄ molybdate/HClO₄ and anisaldehyde; negative with ninhydrin and Dragendorff reagent. It is further characterised by UV, IR and TLC data.

(I) can be used as an antitoxin for neutralising the toxins of streptococci, staphylococci, tetanus etc. (22pp)

27.01.81 as 400116 (1251KB) (F) No-Citns. E(AT BE CH DE FR GB IT LI LU NL SE)

Method for treating casein-based material contg. bivalent (e.g Ca and/or Mg) phosphocaseinates comprises first enzymatic hydrolysis with at least one protease acting like human digestive protease. The hydrolysate is subjected to ultrafiltration using membranes which retain phosphopeptides (I) but allows through peptides which are collected in the ultrafiltrate. The retentate is subjected to deaggregation of (I), then ultrafiltered using membranes which do not retain (I), which are thus sepd. from the enzyme.

Also new are salts of (I) and macro- or micro-elements (esp. Ca, Mg, Fe, Zn, Cu, Cr, Ni, Co, Mn, and Se) and organophosphorated salts of (I) and mineral elements having below 4% total aromatic amino acid content; ratio (Ca + Mg + P):(total nitrogen x 6.38 over 0.2; serine content 8-20%; free amino acid content below 30%.

(I) salts are useful in human nutrition, including therapeutic feeding, e.g. in cases of pancreatic or renal insufficiency, metabolic disorders etc., and as a source of trace elements. They can also be used to treat phosphorus deficiency in human and animals e.g. in calcification of bone fractures, treating osteoporosis or treating rickets. (46pp)

05.02.81 as 440006 (448DH) (F) FR2410824 FR2379816 FR2187115 E(AT DE GB NL SE)

A self-contained, portable, counter pressure bottle filler for taking a full bottle sample from a pressurised vessel contg. a gasified liq., partic. beer from a fermenting vessel or storage keg. The filler is of the type which has a sloping support frame standing on tripod legs and fitted with a carrying handle

The filler comprises a valve block via which an inlet to the bottle neck can be supplied with either gas under pressure or liq to be sampled. The neck has an outlet which is simultaneously connected either to waste via a regulating valve or to atmosphere via a pressure bleed-off valve. A three-way valve can divert gas to atmos. or to a closure diaphragm in a normally open regulating valve. The frame has a support for the sample bottle on its front side and support on its back side for a bottle of inert gas.

A sample can now be taken from a beer fermenting vessel, without allowing the sample to foam and thus lose CO₂, also without the sample coming into contact with air and losing flavour by oxidation and without affecting the temp. or pressure

of the prod. from which the sample is taken. (14pp)

Enhancing growth of acid-producing bacteria in culture media -
 by inclusion of insoluble neutralising agent at start of culture

OREGON STATE UNIV 28.06.79-US-052960

C03 (D13) (04.08.81) *EP--22-341 C12n-01/20 + A23c-09/12

28.06.79 as 052960 (982WB)

Acid producing bacteria used in fermenting foods are grown by inoculating the bacteria into a growth medium contg. H₂O and nutrients for the bacteria and growing the bacteria in the growth medium and using the bacteria for fermenting the food.

Improvement comprises (a) providing a water-insol. non-toxic basic neutralising agent in the growth medium so a part of the neutralising agent remains in solid form in the medium; (b) growing the bacteria in the growth medium in the presence of the neutralising agent with the medium and cells in contact with the neutralising agent, the pH range being maintained so as to promote growth of the bacteria by a controlled reaction of the neutralising agent with at least a part of the acid produced by the bacteria in the medium over a period of time; and; (c) fermenting the food with the bacteria after they have been grown in the growth medium including the neutralising agent.

The neutralising agent is a Mg phosphate or Mg ammonium phosphate in an amt. sufficient with other media ingredients to inhibit lactic bacteriophage. An amt. of neutralising agent is added initially to the growth medium prior to the generation of acid by the bacteria which is at least sufficient to keep the pH above 5.

Method is used in making food and beverage prods. for animals and humans. (10pp)

NAKA- D16 60770 C/35 = US 4282-257
Vinegar of high acetic acid concn. prodn. - by submerged
fermentation in two stages at different temp.

NAKANO VINEGAR CO L 13.02.79-JP-014216

19.12.79 as 105417 (525NS)

Appts. comprises a cell multiplying means consisting of an extended tube draft fermenter having a central draft tube up through which a mixt. of nutrients and air passes. A cell opening means is located atop the fermenter and comprises a stack of units sepd. by perforated plates. Each unit has a jacket through which cooling liq. is passed via inlets and outlets and is fed by nutrient supply line. In use, most of the nutrient rising up the draft tube is deflected back down around the outside of the tube by the perforated plate and again rises up the tube to form a recirculating action. The remainder of the nutrient and the air passes up through the perforated plates where it is mixed with fresh nutrient and temp. treated. Dispersion of the air in the units is ensured by the perforated plates.

Improved oxygen transfer rate to give a higher concn. of microorganisms than prior art. (7pp)

28.01.81 as SE0021 (367DJ) (E) 8.Jnl.Ref N(AU CH DK JP US) E(DE FR GB NL)

Isolation of oligosaccharides (including oligosaccharides bonded to 2-acetamido-2-deoxyhexose units) from cell tissue is effected by selectively cleaving glycoside linkages (including 2-acetamido-2-deoxyhexose pyranoside linkages) in the cell-tissue glycoconjugates (glycoproteins, proteoglycans and glycolipids) with a reagent contg. or comprising trifluoroacetic anhydride (I). The resulting oligosaccharide trifluoroacetates are opt. then de-trifluoroacetylated.

The reagent pref. comprises at least 10 vol.% (I) and up to 90 vol.% trifluoroacetic acid (II). The process is pref. carried out by autoclaving the cell tissue with the reagent (e.g. at 100 deg.C and 4 atmos.), evaporating the reaction mixt. to dryness, partitioning the residue between water and a water-immiscible solvent, and isolating the oligosaccharides from the aq. phase by chromatography. Erythrocyte membranes are pref. homogenised, suspended in water and freeze dried before treatment.

The process is esp. useful for isolating blood-group-specific oligosaccharides from erythrocyte membranes. These

oligosaccharides can be used to isolate antibodies (by immunisation or immunoabsorption) for blood group determin. (17pp)

Continuous centrifuge has an open-topped, internally coned centrifuge basket fixed on a vertical, coaxial, high speed rotary shaft. The vertical shaft rotates in bearings in a housing sleeve which is carried on resilient mountings. The lower end of the shaft extends through the sleeve to be coupled to a drive motor.

The lower end of the shaft is now fitted into the upper half of a coaxial, flexible coupling. The lower half of the flexible coupling

is fixed to the top of a coaxial stub shaft which is integral with coaxial driven pulley. The pulley rotates on a coaxial, internal bearing fitted on an upwardly projecting fixed shaft. The drive pulley is belt driven from a driving pulley on a motor shaft. The upwardly projecting fixed shaft can pref. be adjusted to bring its axis in line with that of the centrifuge basket shaft.

Used for centrifugal sepn. of liq. from solids partic. of syrup from sugar crystals in the mfr. of sugar. The flexible coupling eliminates unequal wear on drive belts which can arise through gyratory oscillations of the basket on its resilient mountings. The drive belts can be in a tunnel isolating them from discharged effluents of sepd. liqs. and solids. (20pp)

Dental amalgam prod. - contains silver tin and copper spherical and irregular shaped particles for improved creep strength
MACRODENT SA 31.01.80-AR-279815

M26 (12.08.81) A61k-06/04 C22c-05/06 C22c-30/04
27.01.81 as 300345 (994KB) (E) No-Citns. E(AT BE CH DE FR GB IT LILU NL SE)

Prod. for use in dental amalgams contains (by wt.) 24-56% Ag, 20-48% Sn, and 12.5-43% Cu. When the Sn/Cu ratio is 1:1-2.5:1 the Ag/Sn ratio is 0.75:1-1.8:1. When the Sn/Cu ratio is 0.75:1-1:1 the Ag/Sn ratio is 0.75:1-2.5:1. At least some of the particles are of irregular polyhedral shape, formed by mechanical means, and the rest are spheroidal, formed by rapid solidification from the liq. state. At least 80 wt.% of the particles are larger than 4 microns.

The powders produce amalgams with greater creep strength, dimensional stability, corrosion resistance and is more easily handled, due to particles being used which have varying chemical compsn, shape and size. (12pp)

PERM-★ D21 60792 D/34 ★ EP --33-687
Two-pack hair bleaching compsn. - with liq. component contg. hydrogen peroxide and colloidal silica and powder component contg. per salts, alkaline agents, etc.

PERMA 30.01.80-FR-001999
(12.08.81) A61k-07/13
28.01.81 as 400121 (513HM) (F) DE2018762 DS1266283 DE2205463 E(AT BE CH DE FR GB IT LILU NL SE)

compsn. comprising hydrogen peroxide, colloidal silica, per salts, alkali agents, organic additives and/or dyes. The liq. component contains the hydrogen peroxide and the colloidal silica, opt. together with organic additives such as gums or surfactants, and the solid component is comprised of a mixt. of the remaining components in the form of powders of similar particle size and density.

On mixing the two components, a paste is obtd. which can be applied to the hair and which does not dry out too quickly. By incorporating the colloidal silica in the liq. component rather than the powder component as previously, separation of the solid component during transport and storage is prevented. (7pp)

E19 P24 (19.08.81) *BE-865-359 A61k-07/06
28.03.78 as 012011 (931BZ)

Hair is conditioned to provide combing, detangling, static fly-away, softness, lustre and manageability. The process comprises rubbing the hair with a flexible substrate contg. 0.2-15 g per sq.m of a normally solid water-insoluble hair conditioning agent releasably associated with it.

The agent comprises an opt. mixt. of a quat. ammonium salt, quat. imidazolium salt, fatty alcohol, sorbitan ester, polyhydric alcohol, fatty acid salt and/or aliphatic ether. The rubbing

action causes the transfer of an effective amt. of agent to the hair.

The substrate used comprises paper, woven- or non-woven cloth, and has size 7 x 10 cms - 50 x 80 cms. The hair is opt. wetted prior to rubbing. (10pp)

MINN D21 55451 A/31 = GB 1596-241
Liq. two/part acrylic tooth filling compsn. - contg. filler to render it visible on the surface of the teeth

MINNESOTA MINING CO 21.01.77-US-761116
A96 (A14) (19.08.81) *DE2803-016 + A61k-06/08
20.01.78 as 002425 (945DJ)

Fluid compsn. comprises (1) liq. resin system polymerisable to solid polymer having glass transition temp. above the normal temp. range of the mouth, (2) 0.1-5wt.% finely divided hydrophobic opaquin filler and (3) 1-10wt.% hydrophobic suspending agent.

Opt. a free radical generating catalyst (I) for (1) is present together with an accelerator (II) reactive with it. The compsn. may be divided into two parts, the first contg. (I) and the second (II), both parts contg. (1)-(3). Suitably (1) comprises acrylic monomer, specifically a mixt. of Bis-GMA and dimethacrylate monomers.

Compsn. is used for sealing pits and fissures in tooth surfaces. It is sufficiently fluid for fast application, sufficiently opaque to be discernible on tooth surfaces and sufficiently shelf stable at low viscosity. (5pp)

LION- ★ D21 60881 D/34 ★ GB 2068-730
Oral compsns., e.g. dentifrices, contg. dextranase - contain L-menthol-carvone mixt. to stabilise compsn. and improve feel

LION CORP 06.02.80-JP-013317
E15 (D16) (19.08.81) A61k-07/28
30.01.81 as 002819 (985AS)

Oral compsns. contg. dextranase also contain carvone and 1-menthol in wt. ratio 1:9-8:2, pref. 2:8-7:3. Pref. the amt. of carvone plus 1-menthol is 0.1-5 (esp. 0.3-3) wt.% based on total wt. of compsn. Anethole (at 0.01-5 wt.% on wt. of compsn.) and flavourings selected from eugenol, methyl salicylate, cinnamic aldehyde may also be present. Pref. the compsns. contain 100-100000 units dextranase per g.

The compsns. have pleasant mouth-feel and are stable. Dextranase is an active ingredient in oral compsn. for caries prophylaxis to prevent formation of plaque. The carvone-1-menthol mixt. provides optimum degree of refrigerant, body and pungency to the compsn. (7pp)

SAKA/ ★ D21 61108 D/34 ★ J5 6081-512
Cosmetic material - prepd. by rendering surface of porous globular granules lyophobic

SAKATA K 06.12.79-JP-158295
(03.07.81) A61k-07
06.12.79 as 158295 (5PW)

Cosmetic material contains substance which is prepared by treating porous globular granules of particle size 0.5-20 micron to make their surface lyophilic. As porous globular granules silica gel, rice starch, etc. can be used and they are made lyophilic either by esterifying with higher fatty acid ester, higher alcohol, etc. or alkyl-etherising them with alkylsilylating agent, etc.. They can be made lyophilic by immersing silica gel or rice starch in ethanol and shaking the mixture for an hour.

The cosmetic material itself shows much better spreading property than kaolin, talc, etc. and showing strong adsorbability for water, can hold perfume for long time. It is nontoxic and being white, can be combined freely in cosmetics of various colours. By combining the cosmetic material in cosmetics such as cream, face powder, lip stick, etc. cosmetics of excellent spreading property, adhesive property and perfume-holding property can be obtd. (3pp)

FREG- ★ D21 61109 D/34 ★ J5 6081-513
Skin foundation cosmetic - contg. substance obtd. by freeze-drying coconut oil lees, pulverising and hydrating with soln. contg. copper chlorophyll sodium salt

FRANCE E & G KK 06.12.79-JP-158460
E12 (03.07.81) A61k-07
06.12.79 as 158460 (5PW)

Skin cosmetic is contain substance which is obtd by (a) freeze-drying coconut oil lees, (b) pulverising it to the powder of below 40 mesh and (c) hydrating it with the soln obtained by dissolving copper chlorophyllsodium salt in water-ethanol mixt. The hydration is completed in 24-48 hours with stirring and the hydrated product is further aged in dark cold room for one or two weeks.

The cosmetic prevents metabolism of skin, moistens skin and gives good foundation effect. When the cosmetic is spread on face and if necessary after steaming, and washed out, the face skin is

cleaned up, deodorised and moistened and has refreshing feel. (2pp)

KANE- ★ D21 61114 D/34 ★ J5 6081-522
Topically administrable compsn. for diagnosing skin characteristics - obtd. by dissolving styryl analogue in hydrocarbon, oil, fat or ester

KANEBO KESHO-HIN KK(NIKA-) 07.12.79-JP-159436

E13 (03.07.81) A61k-49

07.12.79 as 159436 (5PW)

Comps is prepared by dissolving styryl analogue(s) (I) oily substance(s) selected from hydrocarbon, oil fat or carboxylic acid neutral ester.

In the formula R1 and R2 are each alkyl, hydroxyalkyl or alkoxyalkyl R3 is H or alkyl, R4 and R5 are each H alkyl, alkoxy, alkylamino, dialkylamino, acylamino, nitro, halogen or condensed ring.

Compsn is used for diagnosing the state of skin by spreading it on skin detection colour change of the external drug caused from the reaction between the (I) and sebum. Thus one can easily know one's skin state and can select the cosmetic which is suitable to one's skin. (7pp)

Shampoo compsn. - comprising mixt. of specified anionic and nonionic surfactants

SANYO CHEM IND LTD 11.12.79-JP-161286

A96 E12 (E16) (06.07.81) A61k-07/06 C11d-01/83

11.12.79 as 161286 (126RH)

Shampoo compsn. contains 4-40 wt.% anionic surface agent of formula R1CONHCH2-CHR2-O-(AO)n -CO-CH2-CH(SO3M1)-COOM2 (I) (where R1 is 9-15C alkyl; R2 is H or methyl; AO is 2-3C oxyalkylene; n is 0-20; M1 and M2 are H ion, alkali metal ion, ammonium ion, hydroxyalkyl ammonium ion), and 1-10 wt.% nonionic surface active agent of formula R3CONHCH2-CHR4-O-(AO')mH (II) (where R3 is 9-15C alkyl; R4 is H or methyl; AO' is 2-3C oxyalkylene; m is 0-20), exhibiting pH 4-7 of the compsn. system.

Pref. (II) is reaction prod. obtd. by reacting a lower alcohol ester of a higher fatty acid with equimolecular amt. of alkanolamine in the presence of an alkali metal catalyst, removing the excess alkanolamine, and reacting further the residue with alkylene oxide at 60-100 deg.C. Pref. (I) is a salt of a monoester which is a reaction prod. described above with sulphosuccinic acid. Shampoo has high lathering effect. It is Very mild to the skin and mucous membrane. (6pp)

SANN ★ D21 61343 D/34 ★ J5 6082-898
Low irritation shampoo compsn. - contg. anionic surfactant and amphoteric surfactant

SANYO CHEM IND LTD 11.12.79-JP-161285

A96 E12 (E16) (06.07.81) A61k-07/06 C11d-01/84

11.12.79 as 161285 (126HM)

Low irritation shampoo compsn. contains 2-40 wt.% anionic surfactant of formula

R1CONHCH2-CR2HO(AO)n-CO-CH-CH(SO3M1)(CO2M2) (I)

(where R1 is 9-15 average C alkyl; R2 is H or methyl; AO is 2-3C oxyalkylene; n is an integer 0-20; M1 and M2 are H, alkali metal, ammonium, or hydroxyalkyl ammonium), and 2-40 wt.% amphoteric surfactant of formula

R3CONH(CH2)mN + R4R5CH2COO- (II)

(where R3 is 9-15 average C alkyl, R4 and R5 are (m)ethyl; m is 2 or 3).

The compsn. pref. has total amt. of (I) and (II) at least 3 wt.%. Pref. (I) is a monoester salt of sulphosuccinic acid and reaction prod. obtd. by reacting alkylene oxide at 60-100 deg.C with a prod. obtd. by reacting over equimolecular amt. of alkanolamine with a lower alcohol ester of a higher fatty acid in the presence of an alkali metal catalyst after removing excess alkanolamine from the reaction prod.

The shampoo compsn. has all necessary characteristics for shampoo. It is satisfactorily stable at low temp., and has very mild effect on the skin and the mucous membrane of eyes. (5pp)

SHIS ★ D21 61360 D/34 ★ J5 6083-414
Hair cosmetic - contains polyether cpds., obtd. by addn. polymerising propylene oxide

SHISEIDO KK 13.12.79-JP-161975

A97 (08.07.81) A61k-07/06

13.12.79 as 161975 (5PW)

Hair cosmetic is contains at least one polyether selected from (a) the polyether compounds which are prepd by addition-polymerising 20-100 (40-80) ml of propyleneoxide to tri- or higher polyglycerine and (b) polyether compounds which are prepd by addition-polymerising 40-120 ml of propyleneoxide and 1-20 (3-10)ml of ethyleneoxide to tri- or higher polyglycerin.

The polyether compound can be prepared, e.g. by mixing granular caustic soda with the polyglycerin having above five hydroxyl groups, in nitrogen gas, adding propyleneoxide slowly to mixt at 100-120 deg C under internal pressure of 5-7 kg/cm2 and if necessary, adding ethyleneoxide in the mixt.

Pref the polyether compound is used in amt of 5-50% in hair cosmetic. The polyether compound gives proper hair-setting property due to its lyophilic property, is not sticky, shows good affinity to hair, is little corroded with celluloid, can be easily washed out and is at low stimulation and little toxicity (5pp)

FUSO ★ D21 61361 D/34 ★ J5 6083-415
Dentifrice for stiffening gingiva and treating pyorrhoea contains salt and sodium malate to reduce saltiness

FUSO KAGAKU KOGYOK 10.12.79-JP-159972

E12 (08.07.81) A61k-07/16

10.12.79 as 159972 (5WB)

Dentifrice having reduced saltiness is prepd by using salt 8-10 w/w%, esp 9 w/w% and sodium malate 0.5-5 w/w% esp 1-2 w/w% in the basic dentifrice compsn.

Addn of Na malate does not reduce effectiveness of dentifrice (2pp)

LIOY ★ D21 61362 D/34 ★ J5 6083-416
Oral compsn. for dental hygiene - contains plant extract(s), e.g. Ginkgo biloba L, Anethum graveolens L, etc.

LION DENTIFRICE KK 11.12.79-JP-160499

B04 (08.07.81) A61k-07/16

11.12.70 as 160499 (5WB)

Compsn contains at least one extract obtd by extracting plant selected from (a) Ginkgo biloba L leaves, (b) Anethum graveolens L seed (c) unripe fruits or Piper cubeba L., (d) rhizome of Nardostachys jatamansi DC or Nardostachys chinensis Betalin, (e) rhizome of Zingiber officinale Roscoe, (f) rhizome and root of Asiasarum sieboldi F. Maekawa or A heterotopoides F. Maekawa var mandshuricum F. Meakawa, (g) root of Bupleurum falcatum L., (h) Malva silvestris L leaves (i) core of trunk and root of Caesalpinia sappan L., (j) fruits of Terminalia chabrala Rety and (k) Eugenia caryophyllata Thunb. buds, with organic solvent.

The extract is used in tooth paste, tooth powder, mouth wash, troche, pasta, ointment, etc and suppresses acid formation by Streptococcus mutans, etc. (a) or (b) are used in amt 0.002-5%, es 0.002-2% and (c), (d), (e), (f), (g), (h), (i), (j) or (k) are used in amt combined 0.002-5%. (6pp)

OGAW/ D21 11580 A/06 = J8 1032-28
Cosmetic e.g. for skin lotion, hair tonic or lipstick - contains the aq. or organic solvent extract of coix lacryma-jobi

OGAWA Y 21.06.76-JP-072994

(27.07.81) *J52156-936 A61k-07

21.06.76 as 072994 (173HM)

Cosmetics contain, as the medicament, the water or organic solvent extract of the seed and/or root of Coix Lacryma-Jobi.

In an example, 1 pt. wt. of Coix Lacryma-Jobi seed were ground and extracted with 5 pts. wt. of ethanol. The ethanol soln was treated physically and chemically to remove colour, impurities, proteins, tannin, etc. and then evapd. to obtain 0.02-0.05 pts. wt. of the extract. 2.5 Pts. wt. of the extract was mixed with 60 pts. wt. of ethanol, 5.0 pts. wt. of glycerol, 0.4 pts. wt. of surfactant, 22.0 pts. wt. of water and 0.1 pt. wt. of perfume to prepare a hair tonic compsn.

The extract of Coix-Lacryma-Jobi promotes metabolism of skin, hair, etc. It also protects the tissue from UV radiation (J52156936) (4pp)

SHIS D21 65168 V/37 = J8 1032-2
Fingernail enamel fading prevention - by adding dialkyl sulphosuccinate and its derivs

SHISEIDO KK (SHIF) 17.05.72-JP-048701

A82 E17 G02 (A96) (27.07.81) *J49012-045 + A61k-07/04

17.05.72 as 048701 (AT)

Fading of fingernail enamels contg. rhodamine B or its derivs

singly or in combinations, pref. 0.6-2%.

In an example, Et acetate 5, Bu acetate 28, EtOH 1.5, PhMe 32, rhodamine B 0.001, pearly luster-forming agent 2, TiO₂ 0.5, gelling agent 4, and org. pigment 0.1 wt. pt. are mixed with a mixt. consisting of nitrocellulose 12, resin 13, and dibutyl phthalate 6 wt. pts. Then 0.6-2% Na bis(2-ethylhexyl) sulphosuccinate is added to obtain an enamel for fingernails.

The colour of the enamel is long-lasting without fading. (J48012045) (4pp)

SHIS D21 05673 A/03 = J8 1032-284
Gel compsn. for nail enamel use - material formed from organic-modified montmorillonite, (non)polar organic solvent, plasticiser and nitrocellulose, dispersed in solvent

SHISEIDO KK 28.05.76-JP-062020

A96 G02 (27.07.81) *J52145-528 A61k-07/04

28.05.76 as 062020 (5HM)

By dispersing 10-30% chip obtd. by heat-pressing and kneading a mixt. of (a) organic modified montmorillonite 25-70%, (b) (non) polar organic solvent 25-70%, (c) plasticiser 5-35% and (d) nitrocellulose 5-70%, in 90-70% of the mixed (non)polar organic solvent, and mixing it to swell the chip compsn.

Organic modified montmorillonite is obtd. by bonding cationic active agent and nonionic higher organic polar cpd. chemically to bentonite or montmorillonite. The clay stabilises the chip compsn. which can then be handled easily. (J52145528) (4pp)

MATM D21 15720 C/09 = J8 1032-285
Nail lacquer giving hard, flexible, water resistant film - comprises crosslinkable polymer, e.g. a nitrocellulose and an organo metallic cpd., e.g. aluminium ethoxide

MATSUMOTO SEIYAKU KOGYO 06.07.78-JP-082253

Calcium deposits are removed from artificial dentures and other substrates by applying malic-, tartaric-, meso-tartaric- or citric acid. Citric acid is prefd. The acid can be combined with NaHCO₃. NaHCO₃ promotes effervescence and reacts with the acid to release CO₂ which helps to free trapped food particles. A pref. compsn. contains, by wt., 75-95 (80) % citric acid and 5-25 (15) % NaHCO₃. On using hydrous citric acid, the compsns. require drying. This is overcome by using anhydrous citric acid. The compsns. can be used as tablets. Colouring components and aromatics may be added.

The hydroxyacids have high decalcifying and cleansing activity and react with both CaO or lime and CaCO₃. Cleansing can be carried out only once a week. (11pp)

Lavatory door handle steriliser - directs ultraviolet radiation on possible sources of infection on the handle

DUSSY & CO 20.09.77-CH-011527

Handles of doors in public lavatories and in hospitals present a constant risk of infection. This can be remedied by mounting on the wall close to the handle an ultraviolet radiation source. The two areas from which the radiation is emitted are arranged at an angle so that they focus a beam against the handle surfaces. In another version, the ultraviolet steriliser is built into the handle itself, which is hollow and partly made of a transparent material.

This is an effective way of eliminating this possible source of infection. (4pp)

07.02.80 as 004435 (1144KB)

A filter vessel contains vertical hoses, which are sprayed in their bores with a descending stream of wash liq. contg. microorganisms, e.g. in the form of activated sludge. Gases to be purified flow horizontally through hoses from the bores of the latter. The microorganisms pref. consist of a biological concentrate designed to decompose odorous substances in the gas; and enzymes may be added to the wash liq.; located in the threads forming the hoses; or used to impregnate the hoses, to increase the activity of the microorganisms.

A gas cleaner is pref. located upstream of the wet hose filter to remove most of the solids in the gas; and two or more wet hose filters contg. different microorganisms may be used in series to purify gases. Used esp. for deodorising waste gas from sewage drying plants, abattoirs, etc. (11pp)

ROMA-★ D22 80672 D/34 ★DE 3023-245
Improving wood preservative absorption in timber impregnation - by perforating the timber with small holes using a laser beam

SOCROMANDE IMPREGN 07.02.80-CH-000980
C03 F09 P63 (13.08.81) B27k-03/02
21.06.80 as 023245 (280RH)

In a new process for the treatment of wood in order to introduce perforations to improve uptake during impregnation with wood preservatives, the perforations are produced by using at least one laser beam. Used for impregnation of wood with agents such as fungicides, algicides, rotproofing agents, insecticides or flameproofing agents. The process is simple to carry out, does not damage the wood, and gives sufficient perforation to provide for good impregnation with preservative.

Pref. the timber to be treated is passed under the laser along the direction of its fibres, and a salvo of laser beams is fired so that the timber is perforated with a row of slots parallel to the direction of its fibres. Advantageously several parallel rows of perforations are cut in this way, the perforations in one row being slightly offset from those in the next row. Typically, each perforation is 0.1-1 mm across, and rows of perforations can be as little as 3 mm apart so that the number of perforations can be as many as 8000 or more per square metre. (8pp)

passing the mixed gas through catalyst layer contg. at least one oxide of Fe, Mn, Co or Cr to convert aldehyde into organic acid, and passing the gas contg. organic acid through activated carbon layer to absorb organic acid.

Raw gas is introduced into water washing tower, where water soluble substance such as ammonia is removed, and then the gas is mixed with ozone and passed through catalyst layer. Aldehyde in the gas is catalytically oxidised with ozone to give organic acid. The resulting organic acid in the gas is absorbed with activated carbon, and removed.

The process makes it possible to deodorise gas contg. aldehyde using reduced amt. of activated carbon than conventional method, and is useful for deodorising gas contg. aldehyde generated from sewage treatment or industrial waste water treatment. (2pp)

SHID ★ D22 61105 D/34 ★ J5 6081-508
Wood insecticide and fungicide compsn. - comprising aq. alkali metal salt of halogenated phenol, boron cpd. and/or fluorine cpd. opt. with triethanolamine

SHINTO PAINT KK 06.12.79-JP-158554

C03 E14 F09 (E36) (03.07.81) A01n-31/08 A01n-33/08 A01n-59

06.12.79 as 158554 (108DJ)

As boron cpd. there are used boric acid, borax, and borate such as sodium hexaborate. As fluorine cpd. there are suitably used NaF, KF or similar fluoride of alkali metal. As alkali metal salt of halogenated phenol there are used sodium and potassium salt of 2,4,6-tribromophenol and 2,4,6-trichlorophenol.

Prepn. of the compsn. is as follows: 1.5-2.5 wt.% aq. soln. of boron cpd. and/or fluorine cpd. is prepd. Then 10-60 (30-40) wt.% of alkali metal salt of halogenated phenol and if desired, 0.3-2.5 wt.% of triethanolamine are dissolved in water, and 0.1-1 wt.% of the second liq. is added to the first liq. Wood is treated by injecting the compsn. under pressure.

Boron cpd. and/or fluorine cpd. are known to have insecticidal activity. Addn. of alkali metal salt of halogenated phenol imparts fungicidal effect to the compsn. Further, addn. of triethanolamine prevents the pptn. of the alkali metal salt of halogenated phenol in the aq. soln., and at the same time prevents colouring of wood and colouring of the aq. soln. (4pp)

NITL ★ D22 61364 D/34 ★ J5 6083-418
Poultice comprises A-B-A type block copolymer - with water, oil, and glyco:salicylate and/or methyl salicylate, has good storage properties

Prepn. of surfactant - by reacting alcohol ester of fatty acid with more than equimolar amt. of alkanolamine in the presence of catalyst, etc.

SANYO CHEM IND LTD 11.12.79-JP-161287

A96 E16 (D21) (06.07.81) C07c-102/06 C07c-103/38 C07c-139 C07c-143/16 C11d-01/72

11.12.79 as 161287 (126AT)

Polyoxyalkylene type surfactant having pale colour and of formula $R_1CONHCH_2CH(R_2)O(AO)_nH$ (I) is prep'd. by reacting a lower alcohol ester of a higher fatty acid (e.g. methyl laurate, ethyl ester of coconut oil fatty acid, or methyl stearate) with more than equimolar amt. of alkanolamine in the presence of an alkali metal catalyst or alkali metal cpd. catalyst (e.g. sodium methylate), removing the excess alkanol-amine and reacting with alkylene oxide (e.g. ethylene oxide) at 60-100 deg.C. R_1 is 6-22C higher fatty acid residue, R_2 is H or methyl; AO is 2-3C oxyalkylene residue; n is 1-50.

Sulphosuccinate type anionic surfactant of formula (II) and/or (III) is prep'd. by reacting a higher fatty acid ester with more than equimolar amt. of alkanolamine in the presence of an alkali metal catalyst or an alkali metal cpd. catalyst, removing the excess alkanolamine, and reacting the prod. with an alkylene oxide at 60-100 deg.C to obtain a polyoxyalkylene deriv. of formula (I), and further reacting (I) with maleic acid or its deriv. and a sulphite. M_1 and M_2 are H, alkali metal, ammonium, or hydroxyalkyl ammonium.

The anionic surfactant obtd. by this invention has very pale colour and contains a quite small amt. of impurities. Therefore, it has very mild effect on the mucous membrane and skin, and is suitable as a detergent for the use in the kitchen, shampoo, or cosmetics. (5pp)

Carboxylic acids - by reacting olefins with carbon monoxide and water in presence of nickelcobalt iodide

SHELL INT RES MIJ BV 14.08.70-GB-039410

E17 (27.07.81) *BE-771-164 C07c-51/14 + B01j-27/08

12.08.71 as 060689 (KB)

An olefinically unsatd. cpd. an alcohol, an ether and/or a carboxylic ester are reacted with carbon monoxide and water, in the presence of at least 0.002 mole NiI_2 , CoI_2 and/or their precursors per mole H_2O , at 110-240 deg.C and 15-150 atm., the temp. and the molar ratio NiI_2/H_2O or CoI_2/H_2O being correlated.

Esp. useful for prep. of 16-19C acyclic alpha-methylcarboxylic acids, whose sodium salts are used in detergent compsn.

Practically quantitative yields of carboxylic acids are obtd. in shorter reaction times e.g. 2-5 hrs. at considerably lower temps. and pressures than formerly used. (J47004765) (7pp)

UNIL D25 74793 T/47 = J8 1032-359
Washing powders - contg bleaching agent and encapsulated bleach precursor

UNILEVER NV 30.04.71-GB-012379

(27.07.81) *NL7205-8/1 C11d-03/39

26.04.72 as 088614 (BZ)

Washing powders contg. a bleaching agent which releases H_2O_2 and a bleach precursor material with a particle size of 0.3-3.00 mm. comprising at least 40% bleach precursor which passes a 0.15 mm. sieve and a carrier and opt. also a dispersing agent, encapsulated in a protective dispersible coating. Suitable precursors are succinic anhydride, phthalic anhydride, tetraacetylene diamine, etc. encapsulated in PVA, cellulose ethers, (meth)acrylic acid copolymers, dextrine plasticised with sucrose, urea or glucose. Suitable bleaching agents are Na perborate, Na percarbonate, etc. The bleaching agent and encapsulated precursor are mixed into standard alkaline washing powder mixes giving good bleaching action at low washing temps. but with good protection of the precursor from the alkaline reagents. (J49045916)

RECK D25 02418 D/03 = US 4282-109
Aq. thickened bleach compsn. - contg. alkali metal hypochlorite, and surfactant blend of amine oxide and alkali metal alkyl sulphate

RECKITT & COLMAN PROD 30.05.79-GB-018721

E16 (E12 E34) (04.08.81) *EP--21-581 + C11d-07/54

15.05.80 as 149974 (931HM)

Thickened bleach compsn. comprises an aq. soln. of alkali metal hypochlorite and 0.25 wt.% or more of a thickening amt. of a surfactant blend. The blend comprises an amide oxide of formula

$R_1R_2R_2NO$ (I)

and an alkali metal alkyl sulphate R_3-O-SO_3M , in wt. ratio 3:4 or more. In the formulae, R_1 is a 10-18C alkyl, R_2 is a 1-3C alkyl, R_3 is an 8-12C alkyl, and M is Li, Na or K. The compsn. has a viscosity of 60-80 cP.

A measure of control is afforded over the physical properties of the compsn., esp. the Cloud point, which assist the maintenance of the desired cleansing properties even after prolonged storage. (5pp)

Alpha-(di:alkyl hydroxy:malonyl) succinic acid, gamma lactone - intermediates for sequestering agents and/or detergent builders

LEVER BROTHERS CO 01.04.80-US-136189 (18.12.78-US-970840)

E13 (04.08.81) C07d-307/32

01.04.80 as 136189 Div.ex. 970840 of 18.12.78 (478AT)

The lactones (VI) are new, where RR_1 are Me or Et.

(I) are intermediates in a new synth. of aconitic acids, and (allo)isocitric acids (and lactones) (food acids, etc.) the alkali metal salts of which are metal sequestering and/or detergent builders. (10pp)

INFL ★ D25 62206 D/34 ★ US 4282-274
Enhancing the aroma of fabric softeners - with mixt. of 2- and 3-cyclo:tetra:decen-1-one(s) and decanone

INT FLAVORS & FRAGR INC 27.06.79-US-052668 (26.12.78-US-973093)

E15 (D23) (04.08.81) C11d-17/04

27.06.79 as 052668 Div.ex 4183965 (478DJ)

The aroma of a fabric softener (paper or cloth substrate; waxy cationic or nonionic coating; and outer fabric softening coating) is augmented or enhanced by mixing with the outer coating a mixt. of the 3 cyclic ketones (I). Where one of dotted lines is double bond, or both are single bonds).

The mixt. is prep'd. by reacting pyrrolidine deriv. of formula (II) with propargylic acid ester of formula $HCC-COOEt$ by 3 step process. The amt. of (I) added is e.g. 0.05-5%. The parent patent claims the use of the cyclic ketone mixt. to depress the bitter taste of coffee, hops and artificial sweeteners.

The (I) mixt. imparts an intense sweet musk fragrance with exaltone-like, scorched linen, waxy and rooty nuances to fabric softener compsns. (19pp)

Arrangement of Abstracts

'MAJOR' COUNTRIES – An alerting abstract of every basic document is provided, and of examined equivalents from West Germany, Great Britain, Japan, the Netherlands and the United States, and granted and unexamined European and unexamined PCT equivalents. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

DERWENT PATENTS SERVICES

1981 INSTRUCTION CLASSES REGISTRATION FORM

A round of Derwent instruction classes, to be held during September, October and November 1981, will be of very special significance to both new *and* existing users.

The Syllabus of classes is as follows:

Elementary A Coding (IC2)

A two day course for new users of CPI Section A codes, covering basic principles and discussion of examples. Max. 20 participants.

Elementary BCE Coding (IC3)

A two day course for new users of CPI Sections BC & E codes with special reference to the New Chemical Code, again with discussion of examples. Max. 20 participants.

Advanced A Coding (IC4)

A two day course for those with previous training and experience of the CPI Section A codes. Max. 20 participants.

Advanced BCE Coding (IC5)

A two day course for those with previous training and experience of CPI Sections BC & E codes, with special reference to the New Chemical Code and coverage of complex examples. Max. 20 participants.

Online User Instruction
and General Overview (IC6)

A one day course giving in-depth treatment of all access points except special coding, together with formulation of strategy and "hands-on" experience. A general overview of Derwent and its Patents products will also be given. Max. 20 participants.

Advanced Online
Searching (IC7)

A one day course demonstrating the use of special coding concepts and other parameters in the formulation of search logic to retrieve specific subjects or chemical structures. Max. 10 participants.

Cost per person for these classes is: IC2 through IC5 £60 or \$130; IC6 and IC7 £40 or \$90.

LOUE/ ★ D11 62693 D/35 ★FR 2472-917
Bakery hand tool to cut striations in bread dough piece - uses blades fixed beneath cutter plate displaced by solenoid plunger
LOUESSARD M 09.10.79-FR-025030

X25 (10.07.81) A21c-11/12

09.10.79 as 025030 (448HM)

An electrically powered hand tool is for bread prodn. in a bakery. The tool is equipped with blades to form decorative striations in the top of a dough piece prior to baking. The blades are removably fixed on the underside of a cutting plate contained in a housing which the operator position over the dough piece. A solenoid plunger is activated to ram the cutting plate down on to dough surface so that the blades dig into the dough.

The housing is pref. suspended from the ceiling for improved manoeuvrability. (5pp)

VOGE/ ★ D11 62723 D/35 ★FR 2473-267
Cake having a long storage time not contg. flour - contg. sugar, egg white, ground almonds or hazel nuts, chocolate or cocoa

VOGEL A 09.01.80-FR-000407

(17.07.81) A21d-13/08

09.01.80 as 000407 (597)

The mixt. is cooked in a moderate oven. Before mixing commences a small amt. of liquid coffee is pref. added. Egg yolk may also be pref. added. Before cooking, a small amt. of vinegar and/or perfumed alcohol is pref. added to the paste. Three pref. recipes are as follows:- (1) 130-150g non-blanchd grated almonds, 4 eggs, 6-10 cl of water, 3 teaspoons of soluble coffee, 60-120g chocolate or cocoa and 100-120g sugar; (2) 105g non-blanchd grated almonds, 6 eggs, 140g softened chocolate and 150g sugar; (3) 170g grated hazelnut, 6 egg whites, 1 teaspoon of alcohol vinegar, 1 teaspoon of rum or perfumed alcohol, 100g chocolate powder, 120g sugar.

The cake does not contain flour or fats and does not require preservatives, special packing or cold storage. (7pp)

Travelling baking oven - in which gas flows in progressively cooler path along bottom of conveyor and back along its top

BAKER PERKINS LTD 16.02.81-GB-004737 (19.02.80-GB-005599)

(26.08.81) A21b-01/24

16.02.81 as 004737 (525HM)

In a baking oven of the type in which articles to be baked are passed through the oven on a conveyor at least two heaters are provided in a closed circuit gas heating system. The system includes a first blower/heater at the entry end which directs hot gas along a path under the conveyor. At the outlet end of the oven the gas is transferred back to the entry end along a path above the conveyor. As the gas proceeds along the path so it cools, and a heating environment having a desired reduction along the underside of the conveyor and a desired increase along the upperside is produced. At least one further heater is located in the circuit to boost the heating to give a required pattern.

A controllable heating pattern using but a single system. Small circulation volume and less maintenance. (9pp)

Expanded cereal flakes prodn. - by shaping and thermally treating mixt. of grain and soya bean flour, water and additives using live steam

CANNING IND RES INS 26.02.79-SU-731376

(25.12.80) A231-01/18

26.02.79 as 731376 (70VE)

Expanded cereal flakes are produced by mixing flour with salt, sugar and other components and water, cooking the dough, cooling, shaping and thermally treating. The process is accelerated and the quality of the product is improved by introducing water in such amt. that the moisture content of the mixt. is 38-45%; the cooking is carried out with live steam at 105-120 deg.C. for 10-30 min; the thermal treatment is carried out with a heat carrier having temp. of 150-170 deg.C; the air speed is 5-8 m/sec.; the duration is 2-5 min. By this method the denaturation of proteins is diminished. (2pp)

QUAK ★ D11 64100 D/35 ★US 4283-424
Frozen pizza prod. for microwave cooking - has two crust elements of different moisture content

QUAKER OATS CO 06.08.79-US-063945

(11.08.81) A21d-13

06.08.79 as 063945 (67AS)

The prod. comprises a pizza sauce filling located on a crust portion comprising a lower crust element of baked cracker type dough material having a moisture content below 5% and an upper crust element of baked bread dough type crust having a moisture content of 20-40%. The lower crust element absorbs vapour phase moisture created during microwave cooking of the upper crust element and the filling.

The absorption of moisture by the lower crust element prevents undesirable increase in the moisture content of the upper crust element and in turn prevents the pizza developing an unpalatable taste due to excess moisture content in the crust. (5pp)

+ H05b-06/64

19.12.78 as 970898 (963KB)

Lossy susceptor device for microwave energy is claimed, which on continued heating by microwave radiation (I) has a chemical susceptor portion (II) which becomes transparent to (I). Device comprises (a) (II) comprising a solute and a polar solvent, the amt. of solute being at least sufficient to depress the vapour pressure of the solvent by at least 25% of its b.pt. at standard pressure; and (b) a holder for (II) which includes a vent permitting solvent escape when (II) is exposed to (I).

Pref. solute is a Gp.IA or IIA salt, the solvent being water. Also claimed are package for holding a food prod. for microwave cooking, a susceptor as above and foodstuff having low moisture content and density. (15pp)

CARN- ★ D11 64103 D/35 ★US 4283-430
Filled tubular baked food prod. - having shell prepd. from high sugar content batter giving thermoplastic properties

CARNATION CO 14.09.79-US-075613 (14.04.77-US-787697)

(11.08.81) A21d-13 A23g-03

14.09.79 as 075613 (955AS)

In the prodn. of a tubular food prod. having a core of edible filling material, a semi-liquid batter having a relatively high content of mono- or disaccharides is placed between vertically spaced

opposed heated moving surfaces to form a continuous layer of controlled thickness. The batter layer is passed through a heating zone where it is baked to form a continuous pliable thermoplastic sheet having a temp. of at least 212 deg.F and moisture content not more than about 5 wt.%, which is held at a temp. above 210 deg.F and passed through a forming tube in which the edges are raised and the sheet is curved until the edges are butted together to form a continuous tube. A filling is injected at a point below that at which the edges are joined. The tube is then cooled and cut into pieces of desired length.

The batter having a high sugar content gives baked sheets which are pliable when hot but crisp and rigid when cold. The process is continuous and involves fewer steps than known processes. Also a wide range of fillings is possible as the tube is not heated after filling. (13pp)

Plastics, e.g. sausage skin, prodn. process control - by making heat transfer agent flow to regeneration plant less than flow of strengthening soln. to mixer to allow for load variation

AIRAPETYANTS G M 03.01.79-SU-711555
A31 T06 X25 (A97) (10.12.80) D01f-01 G05d-27
03.01.79 as 711555 (840GW)

Controlled prodn. of plastic skins involves stabilising the concn. of the moulding soln. by varying the strengthening soln. flow-rate at the mixer (2) and the heat-transfer agent flow at the regeneration plant (3). The process is made more accurate and is used for process control in the foodstuffs industry. By making the heat-transfer agent flow less than the strengthening soln. flow by an amt. at least equal to any deviation of the moulding concn. from the permissible range on rated load, sausage skin strength can be increased by allowing for the number of spinning machine (1) in operation.

The moulding soln. concn. is measured by the sensor (4) and regulated by the strengthening soln. (5) and heat-transfer agent (6) flow-rate regulators, using the setters (7,8). The flow of strengthening soln. into the mixer is varied by the valve (9), and the heat-transfer agent flow by valve (10). Bul. 45/7.12.80 (2pp Dwg.No.1)

Prodn. of forage by pressing and dehydrating vegetable matter at reduced cost by using dehydrator fumes to heat the evaporator

AGROPROTEINE IND 09.01.80-FR-000450

Q76 (17.07.81) A23k-03/02 A23n-01 A23n-17 F26b-21

09.01.80 as 000450 (448AT)

A process and an installation for the prodn. of pressed cake from fresh vegetable matter e.g. alfalfa. Process comprises pressing the vegetable matter to extract juice and leave a residue which is dehydrated. Effluent vapour from the dehydrator is

circulated through one circuit of an indirect heat exchanger, esp. of the shell and tube variety. Hot vapour from the dehydrator is washed and passed through the other circuit of the heat exchanger which separately exhausts cooled gases and condensate. This has the effect of raising the temp. of the satd. air in the other circuit of the heat exchanger which delivers a conc. juice in high humidity air from which it is separated.

The pressed cake pref. contains not more than 40 wt.% dry matter, esp. 30-40%. Exhaust fumes pref. leave the dehydrator at a temp. of 100-120 deg.C, at atmos. press and with a CO₂ content of 3-10wt.%. (31pp)

Constant pressure bacterial filter partic. to sterilise milk or wine - has ceramic membrane supported by rigid ceramic porous tubular element

CIE GEN ELECTRICITE 11.01.80-FR-000581
P34 (D16) (17.07.81) A611-02/02
11.01.80 as 000581 (448HM)

A continuous steriliser for liqs. comprises a filter capable of trapping bacteria from the liq. The filter has a cylindrical, tubular element made of porous ceramic with pore dias. of 1 to 10 microns. the interior surface of the tube is lined with a ceramic membrane with pore sizes of 0.1 to 0.22 micron.

Liq. to be sterilised is pumped continuously into one end of the passage through the tubular element, where pressure is maintained at a predetermined value by an automatic pressure relief system. Sterilised liq. passes radially outwards through the wall of the tubular ceramic element to be collected in a surrounding reception tank.

The pressure relief system pref. comprises a pressurestat controlling a relief valve which releases liq. for recycling back to the pump, or for passing onwards to a secondary bacterial filter system, or for drawing off laboratory samples. The element tube pref. has a wall thickness of between 0.5 and 2 mm. and the thickness of the membrane lining is between 10 and 50 microns.

Sterilising liq. food prods. esp. milk or wine. There is no loss of nutritive value or deterioration of flavour of the prod. in this sterilisation process. The filter is robust, corrosion resistant, easy to clean and withstands high pressures. (11pp)

 Egg-shaped confectionery article - of hollow or solid form is made in two-part mould with parting line perpendicular to major axis
CADBURY LTD 04.11.77-GB-045900
(26.08.81) A23g-01/21
 21.02.78 as ----- (1044HM)
 Confectionery article has an egg-shaped three-dimensional body formed of an edible confectionery compsn. in a mould having a parting line which is disposed in a plane contg. the minor axis of the body. The body may be solid or of shell form and is made of chocolate and may be at least partially filled with another edible confectionery.
 Used for mfr. of Easter eggs. For a given floor area, egg prodn. can be increased by up to 50% by provision of moulds having parting lines transverse to their major axis. There is less risk of seepage of soft centre confectionery from a hollow shell because of the shorter mould parting line. Since the parting line is circular it is easier to produce a matching seal between the two mould halves. The moulds themselves are mass produced in plastics for very high vol. egg prodn. (4pp)

COXC/ ★ D13 62821 D/35 ★GB 2069-307
 Animal feed compsn. contg. lactose molasses and delactosed whey - with good protein content and feed balance and stable against crystallisation
COXC F 14.02.80-GB-004983
C03 (26.08.81) A23k-01/08
 14.02.80 as 004983 (1248NS)
 Animal feed compsn. comprises a combination lactose molasses and a delactosed whey. Pref. lactose molasses contain about 34% solids, 25% sugar, 2% ash and 1% protein is used, with delactosed whey contg. about 38% solids, 15% sugar, 10% protein, 8% ash and 3% acidity.
 A well balanced feed is obtd., with good protein content, without being too salty for animals to eat it, while it is sufficiently salty to prevent overfeeding with ad lib supply. The compsn. sticks better to silage and other forage feeds than lactose molasses alone, so that wastage through run off is reduced. The compsn. has greater stability against crystn. at low temps., and it does not crystallise on storage. (3pp)

GENO ★ D13 62822 D/35 ★GB 2069-308
 Prepn. of soluble coffee with reduced acid content - by steaming, sweeping with inert gas, then extrn.
GENERAL FOODS CORP 12.02.80-US-120802
(26.08.81) A23f-05/16
 29.01.81 as 002689 (478HM)
 Soluble coffee solids (I) obtd. from an

elongated bed (i.e. length x5 the width) of roasted coffee which has been treated with (super)atmos. steam for more than 10 min. to remove volatile aromas(II) is reduced as follows: (a) the steam flow is stopped; (b) a stream of a non-reactive gas (III) (which will not condense at 0 deg.C) is passed over the steamed bed in the same direction as the steam at above 3m/min. (sufficient to entrain liq. acids in the bed); and (c) the steamed and swept coffee is extracted to afford an aq. extract which is dried. Volatiles removed during the steaming are condensed at 0-20 deg., and combined with the final aq. extract of step (c).

Treated (I) gives a coffee beverage with a relatively high level of flavourful volatiles, and no increase in sour notes. (4pp)

SAGR/ D13 62467 D/35 =GB 2069-309
 Animal feed prodn. from plant residues and waste material - by shock drying, milling to particle size below 2 MM., and sieving out fibre particles larger than 0.35 to 0.75 mm
SAGREDOS A N 13.02.80-DE-005305
C03 (26.08.81) *DE3005-305 A23k-01
 29.01.81 as 002701 (280JB)

In a new process for the prodn. of a feedstuff or feedstuff component from plant residues and waste materials, (A) the plant material is subjected to shock-drying so as to reduce the moisture content as rapidly as possible to 10% or less (pref. ca 5-8%), (B) the dried material is ground to a particle size such that 98-100% has a particle size below 2 mm but at least 8% has a particle size above 0.5 mm, and (C) the ground material is sieved so as to give a fraction with a minimum particle size in the range of 0.35-0.75 mm (depending on the nature of the plant material).

The process utilises otherwise waste materials and gives a readily absorbable prod. suitable for feeding to practically all warm-blooded animals (e.g. hens, calves, sheep, pigs, cattle, goats) which retains practically all of the nutrient value of the raw material but which has markedly reduced raw fibre content and markedly enhanced digestibility. (7pp)

 Cooking oil purifying and clarifying appts. - with perforated diaphragm divided tank for boiling water with oil
HUNT C M 04.02.80-GB-003638
(26.08.81) C11b-03
 04.02.80 as 003638 (1358AS)

Apparatus for e.g. oil used for commercial cooking of fish and chips includes a tank to hold water and oil and with a heating element in its lower part. A perforated diaphragm encloses the element and is located above water level and there is an oil outlet a short distance below the diaphragm and above water level, and a bottom drain.

There is pref. a removable top strainer and the diaphragm is removable and conical. The water is boiled to produce a thermosiphon effect and mix with the oil, then the mixture is cooled so that phases separate and impurities precipitate from the oil to form a layer between oil and water, the oil being drawn off above this layer. Fine powdery coated L-ascorbic acid (salt) prepn. - by adding to organic solvent soln. of hydrophilic wax, oil, fat etc. which is pptd. out onto the L-ascorbic acid (salt)

YOKOHAMA YUSHI KOGY 23.05.78-JP-060618

C02 E13 (03.08.81) *J54154-514 A61k-09/60 + A61k-31/37
23.05.78 as 060618 (5AS)

The method comprises (a) adding at least 1 of hydrophilic wax, oil and fat, fatty acid, natural resin, etc., of which at least 1 has crystallising property, to an organic solvent, in which L-ascorbic acid or its salt shows low solubility and the hydrophilic substance shows high solubility, so that its concentration is 5-50 w/w%, (b) dissolving the hydrophilic substance with heating, (c) adding L-ascorbic acid or its salt to the solution. (d) keeping the suspension for 0.5-24 hrs. at the optimum crystallising temperature of the hydrophilic substance for crystallising out the hydrophilic substance including L-ascorbic acid or its salt as the nucleus and (e) removing the organic solvent. The fine powder is so prepared that L-ascorbic acid or its salt is included 1-80 w/w% in the fine powder. As organic solvent hydrocarbon, ketone, halohydrocarbon, etc. having b.pt. less than 100 deg.C can be used.

Fine powdery coated L-ascorbic acid or its salt, from which L-ascorbic acid or its salt is hardly exposed to air, can be easily prepared without crushing. It is stable and resistant to humidity and can be used as an additive for foods and feeds. (J54154514) (5pp)

HAGG D13 76360 A/43 = J8 1033-395
Decaffeinating vegetable materials esp. coffee - using liquid mixt. of e.g. carbon dioxide and solvent

HAG AG 16.06.77-DE-727191

(03.08.81) *BE-868-203 A23f-05/20 B01d-11 C07d-473/12
14.06.78 as 072034 (597NS)

The selective extraction of caffeine from vegetable materials using a liq. solvent comprises using a two-component mixt. as solvent. The first is, on its own, gaseous under the conditions used and the second comprises a cpd. having physical characteristics such that the mixt. of the two cpds. is liq. at the temp. used.

First components are CO₂, N₂O, SF₆, Xe, CF₄, methane, ethane, ethylene, acetylene, cyclopropane but pref. CO₂ or mixts. contg. CO₂. The second component is pref. substances contained in the vegetable material or waste food prods., e.g. coffee oil.

The process is esp. used for decaffeinated coffee and tea. The process is an improvement on previous processes using carbon dioxide above the critical point or liq. CO₂ which required long extractions with excessive energy consumption, requiring a considerable amt. of appts. rendering the process uneconomic. (J54036299) (7pp)

NIUS D13 01026 C/01 = J8 1033-401
Low mol. wt. chitosan prodn. - by treating chitosan, obtd. by deacetylating natural chitin, with hydrogen peroxide soln. at pH 6-12

NIPPON SUISAN KAISHA 15.05.78-JP-057441

A11 B04 (04.08.81) *J54148-890 C08b-37/08
15.05.78 as 057441 (936AS)

Low mole.wt. chitosan is produced by treating chitosan obtd. by deacetylating natural chitin with 0.007-0.35% of H₂O₂ soln. adjusted to pH 6-12. Chitosan having selected mol.wt. is obtd. without side reactions such as colouring. The glucoside bond of high molecular chitosan is cleaved selectively without any effect on the amino gp. thereof. The desired mol.wt. is obtd. by controlling the reaction time.

Specifically, chitosan is dispersed in water and adjusted to pH 6-12, pref. 9-11.5, and heated to desired temp. with stirring. The H₂O₂ soln. is added to the dispersion in one or several portions. The reaction time is 2-5 hrs. The reaction temp. is 20-90 (pref. 30-70) deg.C. After the reaction, the low mol.wt. chitosan is water-washed, dried and pulverised.

As the H₂O₂ soln. used is cheap and safe, the prod. can be used for intermediate treatment of foods or for cosmetics and medicines. (J54148890) (5pp)

Protein hydrolysates sepn. from sludge contg. hydrolysis mixts. - using ultrafiltration, used for sepn. of animal, vegetable and single cell protein hydrolysates

ANONYMOUS 20.07.81-RD-208026
(10.08.81) A231-00/*
20.07.81 as ----- (513HM)

In the prior art GB2018121 (main claim) a food additive is prepd. from blood by sepn. of a specified sludge from a specified supernatant at a pH of above 4.0. Claim 18 of the same prior art claims sepn. by means of a centrifuge.

It has now been found that sepn. by ultrafiltration gives very high yields of hydrolysate and also eliminates any contaminating microorganisms present in the starting material. The system can also be used to separate other protein hydrolysates than the blood cell hydrolysates indicated in GB2018121 from the accompanying sludge, esp. those originating from seeds, beans or nuts such as soya beans, rape seed, cotton seed, sunflower seed, peas, peanuts, cereals (maize, wheat, barley, oats, rye, rice), potatoes and leaves including alfalfa. Animal protein hydrolysates can also be separated, including those from whole blood, milk, whey, casein and meat, and single cell protein hydrolysates.

Mixt. for cheese spread prodn. - contg. cooking fat, skimmed milk and powder, vegetable oil emulsion, sodium citrate and phosphate, carotene, and phosphatide(s)

UGLICH BUTTER CHEES 27.11.78-SU-689167
(15.12.80) A23c-19/02
27.11.78 as 689167 (70VE)

Cheese spread is prepd. by pasteurising skimmed milk; cooling; emulsifying the fat in skimmed milk; introducing a bacterial leaven and rennet; curdling the mixt.; working the curd, forming and pressing.

This method is improved by introducing into the skimmed milk, before the pasteurisation, an emulsion obtd. by mixing a liquid vegetable fat with a hydrolysed component in a weight ratio of 1/2-1/8-9/, heating to 58-60 deg.C, introducing 1-1.5% of dried skimmed milk, 0.05-10.1% of trisodium citrate, 0.15-0.20% of Na2HPO4, 0.05-0.1% of phosphatides, and 0.1-0.15% of carotene. This mixt. is then diluted with equal quantity of skimmed milk, and homogenised. Before the curd-working, the cheddarisation process is performed.

By this method the biological value of cheese is increased and its consistency is improved. Bul. 46/15.12.80. (3pp)

CANN = ★ D13 63664 D/35 ★SU-786-902
Horse-radish sauce prodn. - from horse-radish, fat, sour cream, pepper, salt, vinegar, flour and broth

CANNING IND RES INS 08.02.79-SU-724933
(25.12.80) A231-01/22
08.02.79 as 724933 (70VE)

Horse-radish sauce is produced by comminuting horse-radish; mixing it with a fat, sour cream, pepper, salt and vinegar; passivating and thermally treating. This method is improved by adding broth and flour; carrying out the passivation in two stages, first by evaporating 10-14% of the mass before the addition of the fat, and in the second stage treating in the fat for 1-2 min. at 140-150 deg.C; the thermal treatment is carried out at 80-90 deg.C. The flour and the broth are introduced before the thermal treatment, and the horse-radish and vinegar afterwards.

By this method, the sauce acquires uniform pasty consistency, good taste and prolonged storage stability, (months). Bul. 46/15.12.80. (2pp)

Hard fat replacer consists of palm mid-fraction and (a) at least 85% pure 1,3-distearyl-2-oleyl glycerol, (b) at least 85% pure 1-palmityl-2-oleyl-3-stearyl glycerol, or (c) a mixt. of (a) and (b) to increase the flexibility of the palm mid-fraction.

Pref. the hard fat replacer consists of 60-75wt.% palm mid-fraction and 40-25wt.% (a). Using the hard fat replacer hardened milk chocolate and plain chocolate suitable for tropical use, can be prep. as well as excellent normal plain and milk chocolates. (15pp)

FRIY ★ D13 64108 D/35 ★US 4283-437
Preventing light-struck in farinaceous foods fried in cotton seed oil - by removal of cyclopropenoid fatty acids from the oil

FRITO-LAY INC 02.08.79-US-063090

(11.08.81) A231-01/21

02.08.79 as 063090 (478AT)

The development of light-induced, undesirable organoleptic characteristics in oil-absorbent farinaceous foods (I) fried in cottonseed oil is prevented by using a non-hydrogenated oil in which the cyclopropenoid fatty acid (II) content is not more than 0.1%.

The cottonseed oil pref. has (II) content not more than 0.05 wt.%, and also has the chlorophyll content less than 0.4 ppm pref. less than 0.3 ppm. (II) (and chlorophyll) may be reduced to the required level by treatment of commercially available, refined, bleached and deodorised (but not hydrogenated) oil with acid-activated, finely-divided adsorbent, e.g. acid-treated Al₂O₃ (total surface area at least 25 sq. m/g pref. at least 50 sq. m/g).

Removal of (II) from cottonseed oil affords fried prods. (esp. potato chips) in which the desirable odour and taste is more effectively retained even under conditions normally leading to light struck. (It is disclosed that (II) are responsible for the presence of 1-decyne in light-struck fried foods). (7pp)

Machine for extrn. of juice from soft fruits - separates stone from pulp by rotor blades pressing juice and flesh through cylindrical screen perforations

GELB G 09.01.80-FR-000375

(17.07.81) A23n-01

09.01.80 as 000375 (448KB)

The machine comprises a horizontal cylindrical chamber at both ends and contg. a coaxial, cylindrical, perforated screen extending full length of chamber. Within this fixed screen a coaxial rotor is turned by an external motor. One end wall of the chamber has an aperture through which fruit is fed into the screen interior. The opposite wall has a discharge aperture through which waste solids to be cleared from the screen interior are removed.

The rotor has a centre shaft fitted with radial arms each carrying a longitudinal blade which sweeps the circumferential inner face of the screen with slight clearance, pref. about 0.5 mm. The rotor pref. has 2-6 blades. At least two blades are pref. angled in opposite directions w.r.t. the swept surface. Between the chamber end wall with discharge aperture and the adjacent ends of the rotor blades, an axial clearance is provided which exceeds the size of fruit stones to be discharged. (9pp)

GUIG/ ★ D14 62751 D/35 ★FR 2473-479
Dispenser for package of frozen prod. from bottom of stack - employs grippers with inflatable bellows jaws spring-loaded against extension

GUIGAN J 16.01.80-FR-000900 (29.01.79-FR-002199)
P27 Q35 (17.07.81) A23p-01 A47f-10 B65g-59/06
16.01.80 as 000900 (448RH)

In the parent patent, a dispensing mechanism delivered a single packet of frozen prod. from the bottom position in a vertical stack of such packages. The mechanism comprises a pair of jaws to grip the bottom package and free it from the remainder of the stack which is retained by a holding device. The jaws and the holding device grip the packages with independently inflatable pads. As a pad collapses to release its grip, there is no danger of ice adhesion between pad and package.

In this addn. each pad now comprises a rigid back plate on which a bellows is fixed to be extended by inflation with compressed air. The bellows has two opposed walls each with a central 'V' formation, the apexes of the 'V's pointing towards each other. The 'V's are opened out as the bellows extends. The apexes of the 'V's are spring-loaded towards each other e.g., by being joined with tension spring.

The spring ensures that the bellows contracts sharply as soon as air pressure is dropped. This makes for a clean, positive release between pad and package. (10pp)

APVC ★ D14 62823 D/35 ★GB 2069-311
Heat treating particulate material - by heat treatment vessel followed by tumbler for treatment with liq.

APV CO LTD 15.02.80-GB-005147
(26.08.81) A23l-03/16

15.02.80 as 005147 (525HM)

Appts. for heat treating particulate material comprises a first rotary heat treatment vessel and a second such vessel adapted to receive a mixt. of heated particulate material and liquid from the first vessel. The second vessel includes a screen which in one position retains the particles whilst allowing the heated liquid to pass to an outlet for recirculation back to the first vessel, and in a second position allows the particles to drop into a second treatment subsequently introduced into the second vessel.

The invention finds use in cooking and sterilising food particles by treatment with live steam in the first vessel and with a sauce in the second vessel. An increased output is achieved over the prior art. (4pp)

NEST ★ D14 62824 D/35 ★GB 2069-312
Batch heat treatment of particulate solids - in rotating vessel with liquid subsequently separated in second rotary vessel

SOC PROD NESTLE SA 15.02.80-GB-005182

Gas roaster using far IR rays - obtd. by coating radiative material with far IR ray radiating material

MATSUSHITA ELEC IND KK 14.12.79-JP-162911
M13 P28 (11.07.81) A47j-36/02 A47j-37/06

14.12.79 as 162911 (117KB)

A gas roaster utilises far infrared rays is obtd. by a coating the surface of a radioactive material made of Cu or its alloy or Al or its alloy with a far IR ray-radiating substance, e.g. CaO, MgO, Al₂O₃, TiO₂, SiO₂, SiC, ZrO₂ etc., and placing the radiative material so treated so as to heat the outer surface of the radiative materials by gas burner.

The gas roaster is rapid and gives even roasting, is effectively applicable to toaster, etc., because the roaster is most suitable for the heating of foods. Thus, the roaster makes a greater contribution to the saving of energy in roasting foods etc. For example, roasting time required for a food is reduced to 1/4 by using this roaster as compared with the case of the conventional roasters. 02.01.79 as 706316 (135GW)

Increased service life of the main bearing in the centrifugal separator for liquid substances processed at 50-100 deg.C., e.g. for cream and animal fats, is ensured by protecting the bearing against heat of the substances being centrifuged. For this purpose, between the central shaft (1) which revolves on spring-tensioned ball bearing (2) and the working chamber of rotor (3) is mounted a screen in the shape of a paraboloidal shell (11) fixed to rotor (3) with screws (14) and sealed with O-ring (15).

The air cushion (12) under shell (11) is connected by openings (13) to the atmosphere. The rotor fixed to shaft (1) by nut (16) contains a packet of conical trays (6), lid (4) clamped to rotor (3) by connecting ring (5), central channel (9) for feeding initial suspension (e.g. cream at 75-98 deg.C.), and openings in lid (4) for discharge of light fraction (high-fat-content cream), and top channel (10) for discharge of heavy fraction (buttermilk). The streamlined shape of protective shell (11) reduces fragmentation of fat globules during the sepn. process. Bul. 46/15.12.80. (3pp Dwg.No.1)

WASS- ★ D15 62379 D/35 ★ DD-148-627
Water restoration by biological sediment decomposition - by introducing enzymes and carbon substrate into local anaerobic zone created by covering

INST WASSERWIRTSCHA 16.01.80-DD-218479

(03.06.81) C02f-11/04

16.01.80 as 218479 (200AT)

In water restoration by biological sediment composition, a local anaerobic zone is created at water bottom by means of a gas-impermeable, movable covering e.g. welded PVC foil sheets. Enzymes and C substrate are introduced into the anaerobic zone, so as to accelerate microbial decomposition. The water enriched with the sediment-released materials is drawn off after completing decomposition and the sediment is stabilised.

The sediment can be stabilised by supplying O₂-rich water or by

phosphates, CO and CH₄. Marsh gas can be led off and used heating the anaerobic zone. (5pp)

(20.08.81) C02f-11/12

09.02.80 as 004826 (39BZ)

Sewage sludge is dewatered in a multi-stage filter press in a first active period of pumping the sludge with additives of or Ca(OH)₂ or FeCl₂ is ended when an upper pressure threshold is reached. In several subsequent cycles the pump is switched reaching an upper threshold and is started when the pressure dropped to a lower threshold. At least the first topping-up cycle started with a time delay relative to the time of reaching the upper pressure threshold which lies between a typical

Although the dry matter content of the filter cake may be at most 2-5% deg. than the optimum of 55%, the filtering time is reduced by 30% and more so that a 25% higher throughput is achieved. (30pp)

IHLE- ★ D15 62415 D/35 ★ DE 3004-855
Measuring waste water activated sludge oxygen consumption - using hollow chamber with internal suction and compression device

IHLE INGENIEURGES 09.02.80-DE-004855
S03 (20.08.81) G01n-37
09.02.80 as 004855 (1297DH)

Arrangement is described for measuring changes in condition of liq. pumped around a loop is esp. for measuring the oxygen consumption in a waste water activated sludge mixt. using a measurement sensor. The liq. is sucked into and forced out of a container (1) internal chamber (4) via an opening. A compression device moves inside the chamber and is of a corresponding cross-section. The pump (5) and measurement sensor (6) forming the liq. loop are arranged inside the container (1). The compression device may be a swivelling flap or a piston (2).

The device is simply constructed, easy to operate and economical. Its control and regulation systems are economical and an additional tempering of the liq. is unnecessary. The device can be cleaned economically. (18ppDwg.No.2)

LENZ/ ★ D15 62430 D/35 ★ DE 3004-961
Construction of basket with internal fabric - for screening particles from cooling or drinking water

LENZ R 11.02.80-DE-004961
J01 K06 P43 (20.08.81) B01d-29/04 B07b-01/46
11.02.80 as 004961 (1480DH)

A basket with an internal screening fabric is affixed to belts motor-driven in a closed circuit or to circular holding drums and is intended for removing particles from outwardly moving liq. It consists of a hollow open structure assembled from angled and flat profiles welded into basket shape. A pre-formed fabric of corresp. shape is gripped inside the basket by clamping strips, washers and holding screws. The baskets are strong enough to resist the pressure differences arising during screening.

Used for removing contaminating particles from drinking water or from the cooling water in thermal or nuclear power stations. The internal location of the fabric makes clamping bands unnecessary, and since standard profiles are widely used and less welding is involved, total production cost is reduced by about 40%. (14pp Dwg.No.3)

BOSC ★ D15 62457 D/35 ★ DE 3005-249
Closed cycle exchanger resin regeneration - by concurrently pumping regenerating agent over resin pref. in two steps and washing

BOSCH R GMBH 13.02.80-DE-005249
J01 M14 (20.08.81) B01j-49 C02f-01/42
13.02.80 as 005249 (200RH)

Ion exchanger resin (A), regeneration by passing a regenerating agent concurrently over (A), the regenerating agent is pumped around in a closed cycle, contg. (A) until the reaction is completed.

The process can be applied to all ion exchangers, esp. to cation exchangers for removing metal ions, e.g. from galvanising plant rinsing waters. A quasi-unending resin column condition is achieved. Exchanger capacity is made high use of with only a small regenerating agent excess, e.g. a 10-20% excess.

Regeneration pref. takes place in 2 steps. A regenerating agent-free, highly conc. extract is formed in the 1st step and a regenerating agent-contg. extract in 2nd step. About half of total regenerating agent required is used in each step. Extract of 2nd step can be used for pre-regeneration in a subsequent regenerating cycle. Regeneration is followed by a pref. multi-step washing process, in which the washing water too is pumped round in a closed cycle. (11pp)

ROTE- ★ D15 62459 D/35 ★ DE 3005-251
Floating material sepn. from grinding waste waters - by adding inorganic acid soln. contg. polyvalent cation and or polyelectrolyte, adjusting pH and flocculating

ROTENBURGER METALLW 13.02.80-DE-005251
(20.08.81) C02f-01/52
13.02.80 as 005251 (200RH)

Grinding-, esp. frictional grinding waste waters are worked up (a) mixing with 0.01-10 (0.1-1)% inorganic acid soln. contg. 5 g/l to saturation, esp. 10.-15 g/l, di- or polyvalent cations and/or 0.1-5 g/l cation-active polyelectrolytes. (b) A neutralising agent is added to set pH 6-9 (6.5-8.5). (c) A flocculant is charged until flocculant concn. in waste water reaches 0.5-20 (1-5)mg/l. While adding the chemicals, the mixt. is stirred. After flocculant addn., stirring velocity is reduced for 10 secs. to 5 min., so that the sludge can be sepd. from water by settling.

Floating materials are flocculated, to form a clear run and a sludge which settles and can be separated by filtration.

The acid in (a) is esp. HCl. The cations can be Fe, Mg and esp. Al and Ca. In (b) pH can be set with milk of lime. While adding the chemicals, the waste water is stirred esp. at 200 r.p.m. stirring is then continued at 60 r.p.m. for 1-2 min. (8pp)

DAMB- ★ D15 62500 D/35 ★ DE 3005-635
Demetallising aerobic clear sludge suspension contg. metal sulphate - by adding cpd. forming soluble metal deriv. which is pptd. and sepd.

DAMBACH-INDUSTRIE AN 15.02.80-DE-005635
(20.08.81) C02f-11

15.02.80 as 005635 (200AT)

In metal-, esp. heavy metal removal from a clear sludge, present as an aq. suspension, an aerobic clear sludge is used, contg. the metal components as metal sulphates. (a) A chemical cpd., (I), is added which converts the metal sulphates into water-soluble metal cpds. (b) The suspension is mechanically sepd. into a solids-rich- and a solids-deficient phase. The solids-deficient phase contains the metal cPds. dissolved in water. (c) The dissolved metal cpds. are pptd. out of the solidsdeficient phase by adding a precipitant and/or flocculant, and sepd. mechanically.

The de-metallised low solids phase can be discharged to sewer system. Sepd. metal cpds. can be recovered. The metal-depleted high solids sludge, contg. about 100 ppm metal, can be used in agriculture. (12pp)

Membrane separator module cleaner - where resistance of flow of cleaning balls in liq. is reduced using two branch port dividers

NITTO ELECTRIC IND KK 07.12.79-JP-159589

J01 (10.07.81) B01d-13

07.12.79 as 159589 (26RH)

A device is claimed for cleaning tubular membrane separator modules assembled in a separator for ultrafiltration, reverse osmotic separation, etc. of a liquid. The modules are connected in parallel to a common raw liquid feeder. Cleaning balls such as soft sponge balls are used for cleaning the surface of each module membrane. The object is to reduce the resistance of flowing balls in the liquid, with use of two-branch port dividers.

The novelty is as follows. A first two-branch port divider is connected to the feeder. To each branch port the first divider, a second two-branch port divider is connected. In such manner the feeder is branched up to the same number of the modules, and the final branch ports are connected to them. Through these dividers, the balls are branched and distributed into the modules. (4pp)

Electrolytic treatment of night soil - by adding sea water and electrolysing using insol. anode and alkali-resistant cathode

MITSUBISHI HEAVY IND KK 17.12.79-JP-163932

(16.07.81) C02f-01/46

17.12.79 as 163932 (34KB)

Night soil is subjected to effective electrolysing treatment to remove in single procedure NH₃ and BOD components and simultaneously to carry out sterilisation by adding sea water in such amt. that chlorine ion concn. of the night soil becomes at least greater than 8 times the NH₃-N concn., followed by electrolysing by means of electrodes comprising insol. anode and alkali-resisting cathode.

The oxidation reaction rate becomes more rapid (2 times) than that in convention break point chlorination process due to not only direct oxidn. with chlorine but also to direct oxidn. by electrode reaction. The electrolysing treatment is carried out continuously over long period without any concn. of hard components e.g. Ca²⁺ and Mg²⁺. Process is performed as sec. or advanced treatment, thereby installation area is largely decreased COD removal, deodorisation and decolourisation are achieved. (7pp)

KURK ★ D15 63423 D/35 ★ J5 6087-496
Removing organic material and phosphorus components from waste water - includes aerobically treating with activated sludge and anaerobically treating sludge in presence of calcium ion

KURITA WATER IND KK 17.12.79-JP-162820

E33 (16.07.81) C02f-03/30 C02f-09

17.12.79 as 162820 (34WB)

Organic material and phosphorus components are removed simply by treating waste water without any

contamination of treated water and with a reduced amt. of components-removing agent and a decreased amt. of sludge (a) treating the water with activated sludge under aerobic conditions to degrade the organic matter and to adsorb the phosphorus components onto the activated sludge (b), treating the sepd. activated sludge under anaerobic conditions at pH 8-9 the presence of Ca(2+) to cause release of PO₄(3-) (c), sepg. into liquor and a P-released activated sludge which is recycled to the aerobic treatment; and (d) contacting the sepd. liquor with a sec. crystal of Ca phosphate, e.g., obt'd. by depositing Ca phosphate on a filter medium, e.g., made of Ca₅(PO₄)₃OH(hydroxyapatite), Ca₅(PO₄)₃F (fluoroapatite), Ca₃(PO₄)₂, natural phosphorus ore etc., in the presence of Ca(2+).

Anaerobic treatment of the activated sludge is carried-out with addition of a portion of the crude water. (5pp)

EBAI ★ D15 63424 D/35 ★ J5 6087-497

B04 (20.08.81) C12q-01/56
4.02.80 as 005540 (280HM)

A new procedure for the determ. of the biological activity of heparin in plasma by the addn. of thrombin or factor Xa as a proteolytic enzyme and of a chromogenic substrate of this enzyme and measurement of the amt. of dye released from the chromogenic substrate, the determ. being carried out in the presence of exogenous antithrombin in accordance with E2812943, the novel feature is that the determ. is carried out in the additional presence of urea.

New reagent for carrying out the above procedure contains 0.01-0.2 mol/l buffer, pH 6-9; 0.05-0.25 mol/l alkali chloride; 200-1100 NIH/l thrombin or factor Xa; 0.12-12 mmol/l chromogenic substrate- 0-0.01 g/l caprotinin; 0-0.03 mol/l EDTA; 0-10 g/l polyethylene glycol; and 20-100 g/l urea.

Used for monitoring blood heparin levels during heparin therapy of patients at risk due to thrombosis. The presence of urea enhances the sensitivity, accuracy and reliability of the determ. at low heparin concentrations. (8pp)

 Prodn. of clean agricultural compost by fermentation of organic waste - after pretreatment by exposure to ionising radiation
JAPAN ATOMIC ENERGY RES 14.01.80-JP-002783
(17.07.81) C05f-09/04

13.01.81 as 000466 (448RH)
 Prodn. of agricultural compost from organic waste material. The Prodn. of agricultural compost and the irradiated material is exposed to ionising radiation and the irradiated material is then fermented with the assistance of a fermenting agent contg. microorganisms. The ionising radiation can be gamma, beta, alpha, or 'X' rays, or streams of electrons or a combination of any of these. The radiation dose provided for the material is pref. between 10 power 4 and 10 power 7 rads.

The moisture content of the material during fermentation is pref. maintained between 40% and 60%. This can be done by

mixing in a humidity modifying agent such as straw or sawdust. The material is pref. irradiated in the presence of air which may be injected by a blower.

Used in making compost from organic waste such as sewage sludge, animal manure, town sewage, stable litter etc. The process eliminates objectionable smells and obviates the possibility of spreading contamination with pathogenic bacteria, parasites eggs, seeds etc. The compost produces no rapid fermentation in treated soil which might endanger crop yield. (12pp)

 16.01.80 as 000891 (448HM)

Power driven handling mechanism is for manipulating a crate contg. bottles of wine being treated in accordance with the champagne method of sediment accumulation and ejection.

The mechanism comprises a frame-work enclosure in which the crate is secured for manipulation. The enclosure base is pivotally mounted w.r.t. a horizontal base frame so that the enclosure base can be tilted between a position parallel to the base frame and a position at 90 deg. to the base frame. The complete enclosure can be power rotated about its central axis at right angles to the base of the enclosure.

The tilting action of the enclosure is pref. obtd. via a linkage fitted with nuts which engage jacking screws rotated by motor driven gear boxes.

Used for manipulating crates contg. bottles of wine receiving champagne method treatment, i.e. controlled tilting, turning, inversion etc. to accumulate and eject sediment of secondary fermentation. Mechanical handling which eliminates practically all the manual labour previously demanded of cellarman. Reduces training and experience required by 'removers'. With crates each contg. 504 bottles a single cellarman can treat about 25,000 bottles per day. (17pp)

Recombinant DNA contg. amylase coding gene - for genetically engineering microorganisms to produce amylase
CPC INTERNATIONAL INC 12.02.81-GB-004473 (15.02.80-GB-005184)
B04 (26.08.81) C12n-09/26 C12n-15
 12.02.81 as 004473 (985HM)

Recombinant DNA contg. a amylase coding gene (I), prepd. by the in vitro process of cleaving DNA derived from a bacterial donor microorganism (1) and combining the resulting DNA fragments with a vector (II), is new. (II) comprises a plasmid (pref. pBR322, pACYC 184 or pC 194) or the DNA of a deriv. of phage lambda (pref. of phage lambda NM590, NM781 or NM989).

A genetically engineered microorganism (2) contg. the recombinant DNA of (A) is new. Pref. (2) is capable of producing amylase, when cultivated, in amts. greater than that produced by (1).

Prodn. of amylase comprises cultivating (2). Pref. (i) the recombinant DNA is present in the form of a lytic phage and cultivation is in an infected bacterial host; (ii) the DNA is in the form of a phage in a lysogenic E.coli and cultivation is carried out so as to induce phage multiplication by heat treatment; or (iii) the DNA is in the form of a plasmid and cultivation is by growth to the stationary phase.

(2) can be used to produce amylases, esp. on alpha- or beta-amylase or a pullulanase. These enzymes are useful in industrial enzymatic starch hydrolyses (e.g. liquefaction and/or saccharification of starch to produce adhesives, sizings, malto-dextrins, starch syrup, maltose, dextrose, etc.) with flavourable properties such as resistance to high temp., heavy metal poisoning etc. (2) are prepd. by the transfer primarily of the gene for the prodn. of a single amylase therefore minimising the purifcn. problems in the amylase mfr. (19pp)

FARH ★ D16 62879 D/35 ★ GB 2069-504
Microbiologically prepd. human interferon - DNA and plasmid(s) for coding for this interferon, and sepn. of mRNA from human fibroblasts
HOECHST AG 16.02.80-DE-005843
B04 (26.08.81) C07g-07 C12n-15
 16.02.81 as 004763 (985HM)

The following are new. (i) a microbiologically prepd. polypeptide (I), all or part of which comprises the aminoacid sequence of human interferon (pref. of human fibroblast interferon); (ii) a CDNA which codes for (I) whenever prepd. using mRNA obtd. from human fibroblast cells; (iii) a plasmid (pref. pBR 322) which comprises the CDNA of (ii), (iv) a microorganism (A) which comprises the genetic information required for the biosynthesis of (I); and (v) prepn. of RNA which comprises arranging a caesium chloride-free lysate (pref. of human fibroblasts) as a layer on an aq. CsCl soln., centrifuging the resulting system and obtaining the RNA.

(A) can be used to prepare human interferon which has antiviral, cell division inhibiting and immunological reactions regulating activity. Use of CsCl-free lysate achieves the most complete possible sepn. of mRNA from the RNA mixt. (6pp)

WATM- ★ D16 62895 D/35 ★ GB 2069-502
Controlling final carbohydrate content of beer - by adding pullulanase to mash of ground malt, holding to desired sugar level, then enzyme inactivation
WATNEY MANN TRUMAN 08.02.80-GB-004334
(26.08.81) C12c-07/04
 08.02.80 as 004334 (478HM)

The final carbohydrate (I)-content of beer is controlled as follows (a) a mash of ground malt is held at a temp. sufficient to gelatinise the starch (II) but retain the amylase activity; (b) the mash is cooled to below 60 deg.C and the enzyme pullulanase added; (c) the mash is held until the desired fermentable sugar level is reached; and (d) the filtered wort is boiled to inactivate the enzymes.

Starch hydrolysing enzymes are inactivated by boiling in a copper-kettle and are not active in the beer during or after fermentation, and fermentation is faster (glucose inhibition of yeast does not occur). In addn., prepd. beers have good foaming stability and good flavour characteristics. (4pp)

 -Glutamic acid fermentative prepn. - by inverting sucrose in cane molasses, culturing bacterial strain which produces the acid and recovering acid

AJINOMOTO KK 14.12.79-JP-162256
 B05 E16 (11.07.81) C12p-13/14 C12r-01/*
 14.12.79 as 162256 (5AB)

Method comprises (a) inverting above 60% of sucrose in cane molasses with invertase, (b) culturing the bacterial strain which produces L-glutamic acid in the culture medium contg. the cane molasses obtd. in (a) as the major carbon source and (c) recovering L-glutamic acid accumulated in the cultured medium.

L-Glutamic acid can be produced with higher yield in the culture medium contg. the cane molasses, of which sucrose is previously inverted with invertase as the carbon source c.f. that obtained in the culture medium contg. cane molasses without inversion. (5pp)

SAH ★ D16 63134 D/35 ★ J5 6085-291
 -Tryptophan prodn. using microorganism - by reacting indole with serine or pyruvic acid and ammonium ion using *Aeromonas*, *Vibrio* or *Bacillus* microorganism

ASAHI CHEMICAL IND KK 13.12.79-JP-160863
 B02 E13 (11.07.81) C12p-13/22 C12r-01/63
 13.12.79 as 160863 (52KB)

Prodn. of L-tryptophan comprises reacting indole with serine or with pyruvic acid and ammonium ion in presence of a cultured microorganism or its processed material of a strain of genus *Aeromonas*, *Vibrio* or *Bacillus* which can convert indole and serine, or indole, pyruvic acid and ammonium ion into tryptophan. L-Tryptophan is an essential amino acid used as drug, nutrition aid or animal feed additive. The invention provides a new process for producing L-tryptophan by new microorganisms.

Organism is *Aeromonas hydrophila* subspecies *hydrophila* IFO 6558, IFO 12978 and IFO 12981; *Aeromonas hydrophila* subspecies *anaerogenes* ATCC 15467; *Aeromonas punctata* subspecies *punctata* IFO 12716; *Vibrio anguillarum* ATCC 14181 and ATCC 19264; *Bacillus alvei* ATCC 6344. The microorganisms may be cultured on a conventional natural or synthetic medium contg. C source, N source and other inorganic or organic nutrients at 25-37 deg. C for 16-96 hrs. It is necessary to add L-tryptophan (0.1-0.7%) to the medium since the enzyme tryptophanase produced by the organism is an adaptation enzyme. The resultant culture broth may be used directly in the reaction, or the organism isolated from the broth by centrifugation or its processed material obtained by ultrasonic wave treatment, autodigestion or grinding may be used. (4pp)

APS ★ D16 63135 D/35 ★ J5 6085-297
 -ergosterol prodn. - by aerobically cultivating appropriate yeast strain in medium contg. isoprenoid substrate and acetoacetate

JAPAN SYNTHETIC RUBBER 12.12.79-JP-160266
 B01 (11.07.81) C12p-33 C12r-01/85
 12.12.79 as 160266 (52WB)

Prodn. of ergosterol comprises culturing aerobically an ergosterol producing strain of yeast in a medium contg. one or more additives of isoprenoid-substrate sources (specific: AcOH and/or leucine) and acetoacetate, and non-ionic surfactants to accumulate ergosterol in the organism, and recovering ergosterol from the organism.

Preferred yeasts include *Saccharomyces cerevisiae* IFO 0334, *S. varium* IFO 0565, *Pichia farinosa* IFO 0604, *Candida tropicalis* IFO 006, *S. lipotica* IFO 0746. The isoprenoid-substrate source includes AcOH, fatty acids, leucine, n-paraffin etc., which may be used in amt. 0.1-3 w/v%. Acetoacetate (Me or Et ester) may be used in amt. 0.1-2.0 w/v%. The non-ionic surfactants include sorbitan fatty acid esters (e.g. sorbitan monolaurate), polyoxyethylene sorbitan fatty acid esters (e.g. POE sorbitan monopalmitate), etc., which may be used in amt. 0.1-1 w/v%. The yeast may be cultured on a medium contg. the additives as well as conventional inorganic salts, C source, N source and trace elements. The use of the additives markedly increase the yield of ergosterol. (4pp)

SAH ★ D16 63136 D/35 ★ J5 6085-298
 -Amino-cephem cpd. prodn. - by first adsorbing amide bond cleaving enzyme on porous ion exchange resin

ASAHI CHEMICAL IND KK 14.12.79-JP-161582
 B02 (11.07.81) C12n-11 C12p-35/02
 14.12.79 as 161582 (52AS)

Microbiologically prodn. of 7-aminocephem cpds. of formula (I) from cpds. of formula (II) is characterised by adsorbing an amide bond cleaving enzyme (capable of producing (I) from (II)) on a porous ion exchange resin, and acting the resultant fixed

enzyme on cpds. (II). R is -COOH or -COCOOH; X is nucleophilic gp., esp. H, OH, acetoxy, pyridyl, or thiazole gp.

(I) is obtd. in high yield. (8pp)

 Determin. of free fatty acids - includes reacting acyl coenzyme/A synthetase with the acids with acyl coenzyme/A to produce hydrogen peroxide

AMANO PHARM KK 12.12.79-JP-160293
 B04 E17 (11.07.81) C12q-01/48 G01n-33/50
 12.12.79 as 160293 (52WB)

Enzymatic determ. of free fatty acids comprises reacting acylcoenzyme A synthetase (acyl-CoA synthetase) with free fatty acids in presence of adenosine triphosphate (ATP) and coenzyme A (CoA) to give acylcoenzyme A (Acyl-CoA) (reaction system 1), reacting acyl-CoA with acyl-CoA oxidase to give H₂O₂ (reaction system 2), and quantitatively analysing H₂O₂ produced colourimetrically with 4-aminoantipyrine and phenol reagent in presence of peroxidase. Myokinase is added to the reaction medium of system 1 to quickly complete the reaction.

In previous methods in which acyl-CoA synthetase is reacted with free fatty acids in presence of ATP, the produced AMP inhibits generation of acyl-CoA and the subsequent reaction of acyl-CoA with acyl-CoA oxidase gives H₂O₂ in poor yield not corresp. to true amt. of free fatty acid. In this method, AMP is removed from the reaction medium with myokinase in order to accelerate the system 1 reaction to give acyl-CoA in sufficient yield. (5pp)

KARA/ ★ D16 63232 D/35 ★ J5 6086-195
 -Anticancer crucivin prepn. - by culturing e.g. *Pseudomonas crucivlae* IFO 12047 strain

KARASAKI T 18.12.79-JP-163505
 B04 (13.07.81) A61k-35/74 C07g-11 C12p-01/04 C12r-01/46
 18.12.79 as 163505 (69KB)

Crucivin is produced by culturing crucivin-producing microorganism and taking out crucivin from the culture body. As crucivin-producing microorganism may be used *Pseudomonas* genus of bacteria, partic. *Pseudomonas crucivlae* IFO 12047 strain. Crucivin has striking anticancer action at lower dosage of 1/20 of LD₅₀ value. LD₅₀ on abdominal admin. is more than 1000 mg/kg and there are found no antibacterial action nor hemolytic action and the fact indicates absence of cytotoxic drug. (5pp)

Plant virus disease controlling agent - comprises cpd. AM-3672 which may be used for protecting tobacco, tomato and green pepper crops

GODO SHUSEI KK(KITA NISC) 20.12.79-JP-164843
C03 (16.07.81) A01n-63/04

20.12.79 as 164843 (108WB)

Plant virus disease controlling drug contains as active component a new cpd. AM-3672 having the following properties; (1) it consists of carbon, hydrogen, nitrogen and oxygen, and has an elemental analysis of C62.82%, H 7.35%, N 4.88%; (2) Mol.wt. of 574; (3) M.pt. of 230 deg.C and (4) specific rotation (alpha)D20 of +137 deg. (c=1, chloroform).

The active cpd. can be prepd. by cultivation of FERM-P No. 4335 strain given in Japanese Patent application 086080/78.

In an example 1 pt. of the active cpd., 95 pts. of carrier, 2 pts. of surfactant and 2 pts. caking-preventing agent are mixed and pulverised to give wettable powder. When used it is diluted 20-2,000 times with water and then applied.

The active cpd. prevents crops such as tobacco, tomato and green pepper from infection with plant virus. It is not phytotoxic. (2pp)

KYOW ★ D16 63472 D/35 ★ J5 6087-594
Antibiotic XK-209 obtd. by cultivation of microorganism - of the chainia genus, contains l-threonine and l leucine units and is positive to the ninhydrin reaction

KYOWA HAKKO KOGYO KK 20.12.79-JP-164832
B04 (16.07.81) A61k-35/74 C07g-11 C12p-01/06

20.12.79 as 164832 (140NS)

New antibiotic XK-209 has the following properties: 1) M.Pt. : 165-170 deg.C (decompsn.), 2) Elementary Analysis: C : 51.85%; H 6.72%; N 12.76%, 3) Mol.Wt. : Ca. 660, 4) Specific rotatory power : -40 deg.C (c is 0.1, H₂O), 5) UV spectrum : Given 6) IR spectrum : Given, 7) Hydrogen NMR spectrum : Given and 8) Urea NMR spectrum : Given.

The antibiotic is a white powder, soluble in water, methanol; insoluble in ethyl, acetate, chloroform, n-hexane, in Silica Gel TLC gives Rf 0.13 (chloroform:methanol:conc. aq. ammonia : 1:1:1 v/v).

Liquid cultivation, partic. submerged shake culture is suitable. The cultivation is pref. conducted aerobically at 25-40 deg.C (27 to 30 deg.C), at pH 4-10 (5-9) for 2-5 days. XK-209 is pref. recovered from the culture by recovering the microorganism metabolite. For example, the culture is filtered using a filter aid (e.g. diatomaceous earth). The culture filtrate is passed through a column of activated carbon and eluted with aq. acetone. The XK-209 contg. fractions are collected, conc. and subjected to column chromatography to increase purity and finally the aq. soln. is liophilised. (8pp)

03.09.75 as 106031 (38NS)

The prepn. of amino sugar deriv. (I) comprises reacting N-acyllividomycin B with periodic acid, reacting the resultant dialdehyde cpd. with amine to eliminate the neosamine B-part followed by opt. deacylating. The periodate oxidn. is completed at room temp. for 5-30 hrs. in a solvent (water, and/or lower alkanol), pref. in the dark, whereby neosamine B is cleaved between 3- and 4-positions to give corresp. dialdehyde. Reaction of the dialdehyde and amine (e.g. phenylhydrazine or triethylamine) is carried out at room temp. 200 deg.C for 1-10 hrs. pref. in the presence of acid in the above solvent, or at room temp. for 1-10 hrs. In (I) R is H or acyl.

The starting material, lividomycin is the antibiotic produced by culturing *Streptomyces lividus* (previously named *quintomycin D*) and is effective to Gram-positive and negative bacteria, acid fast bacteria and esp. to *Pseudomonas*. The prod. (I) has antibacterial activity and is also useful as synthetic intermediate for other antibiotics. (J52031051) (4pp)

DPO = ★ D16 63626 D/35 ★ SU-785-354
 mash distn. appts. automatic control - by measuring alcohol
 concn. and varying parameters of regulators for mash and steam
 accordingly via functional units
KRASD POLY 23.01.79-SU-718800
 (10.12.80) C12f-01/04
 01.79 as 718800 (840GW)
 distilling appts. control by stabilising the concn. of the distillate,
 column bottom temp. and distillate temp. in dynamic regulation
 of the mash (12), water (7) and steam (10) regulators is made more
 accurate for application of automation when the alcohol concn. of
 the mash is widely variable. By measuring the alcohol concn. (13)
 and varying the parameters of the regulators for the mash and
 steam accordingly, the max. deviation of parameters and
 transient behaviour are reduced by a factor of 2-4. (3pp Dwg.No.1)

URE D16 43426 Y/25 = SU-786-855
 antioncogenic nitrogen-contg. polysaccharides - by extraction of
 basidiomycetes with an aq. solvent at elevated temp. and press.
KUREHA CHEM IND KK 18.12.75-JP-150114
B04 (07.12.80) *BE-849-476 A61k-35/70
 12.76 as 428806 (GW)

Polysaccharide antioncogenic nitrogen-containing substances
 are obtd. by extraction of fungi of the basidiomycetes class (esp.
Coriolus and *Lentinus*) with an aq. solvent, under press.
 ref. 1.8-20 kg/sq.cm.) at 120-200 deg.C. The extn. period
 generally varies between 5 and 360 mins. and the aq. solvent is
 usually water or a dilute alkaline soln. of less than 1 normality.
 The polysaccharides have excellent antioncogenic activity.
 They inhibit sarcoma-180 in mice, not only when administered,
 but also by oral administration. They stimulate immune
 responses, avoiding secondary effects of chemiotherapeutic
 treatment, giving increased sensitivity to radiotherapeutic
 treatment, combat diminution of physical resistance of patients
 after surgery or blood transfusions and increase resistance to
 viral and bacterial infections. They also improve hepatic
 function and appetite, soothe intestinal disorders and stimulate
 biliary secretion. They are also effective against leprosy.
 Known methods of extraction under normal pressure give only
 low yields of antioncogenic substances, wasting valuable prods.
 Bul. 45/7.12.80. (5pp)

 07.04.76 as 346800 (89WD)

Intensified foam breaking during microorganisms culture is ensured by a pipe set coaxially inside the shell. The resulting clearance w.r.t. the wall of the shell and the conical insert below the pipe control the flow.

The air is periodically fed into pipe 2 and impacts the conical insert 3 to form bubbles rising inside the shell 1. The bubbles force the liquid and act as a piston with the pushed liquid causing hydraulic shocks when the gas bubbles collapse on reaching the surface. Bul.46/15.12.80. (2pp)

Lorry held grapes sampler - has squeegee blade operating camshaft in perforated semi-cylindrical vessel
 AIGEZARDSK WINE WKS 07.02.79-SU-724916
 (17.12.80) C12g-01/02
 07.02.79 as 724916 (89WD)

Faster sampling of grapes from the lorry load and improved accuracy of determining the sugar content are due to sampler crankshaft in the semicylinder vessel with perforations. Additional units of similar design are attached to the movable frame featuring a hydraulic drive, while the actuators are connected to a timer and operate in synchronism with each other. The three samplers are lowered with the frame by the hydraulic drive and the timer switches on the actuators for turning the camshaft 5 which reciprocates blade 6. The latter picks up a bunch of grapes for pushing into the perforated semicylinder II for squeezing out the juice. The skin of grapes and stems remain intact while the juice flows down into the collector 14 operating under a vacuum. Bul.46/15.12.80. (4pp) (Wg.No.2)

Stabilised fluorescent label - contg. rare earth chelate and polymeric beads derived from loaded latex

EASTMAN KODAK CO 18.10.78-US-952424 (28.12.77-US-865274)

A96 B04 S03 (11.08.81) G01n-31 G01n-33/48
 18.10.78 as 952424 (1248BZ)

Aq. stabilised fluorescent label (I) comprises a fluorescent rare earth chelate (II) incorporated into polymeric beads derived from a loaded latex. The (I) contains up to 7.5% (II). The loaded latex has a polymeric discontinuous phase comprising polymer obtd. from ethenic monomer(s) and has an aq. continuous phase and shows no coagulation or settling out when 250 ml latex contg. 10-20% dispersed phase is stirred at 25 deg. C into an equal vol. of acetone over 1 min. and the mixt. is set aside at 25 deg.C for 10 mins.

The fluorescent quenching of (II) by aq. liqs. is eliminated when they are in the bead latices. They are useful for the prepn. of highly efficient proteinaceous reagents, by absorbing or covalently binding antigens, antibodies, plant lectins etc. on the surface of the beads. The labels have longer lives, so that e.g. time resolution for reducing background in fluorescence immunoassay systems and premature pptn. does not occur. (9pp)

MEIJ D16 32784 C/19 = US 4283-389
Antibiotic BN-183B prepd. by cultivation of Pseudomonas BN-183 - is active against Gram-positive and Gram-negative bacteria and has anticancer and antiviral activity

MEIJI SEIKA KAISHA 27.12.78-JP-159820
 B04 C03 (11.08.81) *BE-880-850 A61k-35

19.12.79 as 105442 (963HM)

Antibiotic designated BN-183B (I) is claimed, the hydrochloride of which is characterised e.g. by a mol. formula of $C_{14}H_{20}N_2O_6Cl_2 \cdot HCl$, a mol. wt. of 383, and has positive reactions to $FeCl_3$, Ninhydrin, and Fehling, but negative to Molish and biuret.

(I) may be obtd. by culturing e.g. *Pseudomonas* sp. BN-183 strain (FERM-P.No.3332; ATCC 31571).

(I) has strong inhibitory action on Gram positive and negative bacteria. It also has anticancer activity, and antiviral activity. (I) has LD50 in mice of 50 mg/kg (oral); 4.1mg/kg (intravenous; or intramuscular); 4.3 mg/kg (intraperitoneal); 6.0 mg/kg (subcutaneous). (7pp)

Antibiotic A-39183 factor C, prepd. from Streptomyces sp. NRRL 12049 - esp. useful against penicillin resistant Staphylococcus and Streptococcus spp.

ELI LILLY & CO 01.11.79-US-090386
 B04 (11.08.81) A61k-35

01.11.79 as 090386 (1251BZ)

Antibiotic A-39183 factor C (I) is new. It is a yellow crystalline solid with the following characteristics: (a) analyses C 68.03%, H 4.78%, O 26.58%;

(b) has mass spectrometric mol. wt. 598;

(c) shows IR absorption max. (reciprocal cm) at 3498, 3420, 2970, 2930, 2861, 1971, 1717, 1701, 1623, 1599, 1585, 1452, 1414, 1367, 1335, 1312, 1261, 1223, 1172, 1151, 1122, 1086, 1041, 1011, 980 (Sh), 970, 955, 938, 905, 879, 870 (Sh), 851, 801, 781, 750 (Sh), 740, 692 and 666 (Sh indicates a shoulder);

(d) has UV absorption max. (in nm) in acidic or neutral methanol at 226 (44,200); 268 (55,600); 300 (Sh) (6,200); 310 (Sh) (5300); 327 (5,900) and 410 (13,800) and is basic methanol 229 (50,100); 226 (49,200); 328 (Sh) (11,000); 340 (11,900) and 420 (17,000); figures in parentheses are extinction coeffs.;

(e) is soluble in acetone, ethyl acetate, DMF, DMSO, tri-fluoroethanol and lower alkanols; sparingly soluble in benzene and toluene and insoluble in water; and (f) has approx. Ref value 0.46 in silica gel t.l.c. using 3:1 toluene-acetone as solvent.

The complex is obtd. by submerged aerobic cultivation of *Streptomyces* sp. NRRL 12049, pref. in a medium contg. 0.2-0.7 vol.% polypropylene glycol of mol. wt. 1200-2000 (this increased the yield by 100% and inhibits foaming).

(I) is an antibiotic effective against *Staphylococcus* and *Streptococcus* species resistant to penicillin. It is also active against some Gram-positive and -negative anaerobes, and is an ionophore (for use in Ca transport; Ca-Mg partitioning and to facilitate uptake of ferrous ions by mitochondria). (13pp)

Vacuum condensn. plant e.g. for sugar refinery - has uncondensed gas cooler connected to fresh water line before first stage of condenser

DOVGOPOL VI 25.03.77-SU-466475

J01 Q78 (17.12.80) B01d-01 F28b-03/06

25.03.77 as 466475 (18GW)

The plant comprises a mixing condenser (1) with series connected steam stages (2 and 3), to the first of which is connected a pipeline (4) supplying fresh water, and to the second, pipeline (5) supplying recycled water. For greater economic efficiency, it has a cooler (6) for the uncondensed gases, connected to the fresh water pipeline in front of the first stage of the condenser.

With the hot gases and cold water in direct contact in counterflow, the gases are completely cooled, with simultaneous heating of the fresh water supplied to the first stage (2) of the condenser (1). This avoids pollution of rivers etc. with effluent, reduces fresh water consumption, and reduces the temp. of the departing uncondensed gases. Bul.46/15.12.80. (2pp Dwg.No.1)

WESS- D17 86325 B/48 = US 4283
Washing particulate feedstock esp. starch in hydrocyclones arranged as multistage enclosed system with partial final starch recycling

WESSANEN NEDERLAND 24.05.78-GB-022187

P41 (11.08.81) *EP--5-651 C131-01

23.05.79 as 042601 (1358WB)

Particulate starch is upgraded by counter-current washing water in a cascade of hydrocyclones with starch suspension from one end and wash water to the other. The underflow stream of each stage except the last is pumped directly into the next stage while the overflow is introduced into the feed line to the previous stage at the inlet side of the pump in that line.

The first stage overflow stream contains remaining contaminants and is discharged from the system. All stages are operated as a totally enclosed system with the different stages interdependent. Final stage underflow containing the washed product is partly discharged from the system and partly recycled directly to the final stage via the inlet side of the feed line pump. (10pp)

(03.06.81) C14b-01/02

17.01.80 as 218498 (39HM)

Machine to remove the fatty tissue from the flesh side of pig's skin consists of two treatment systems. Each includes a scraper tool roll, a thrust roll, and a transport roll. The first system treats a skin to three-quarters of its length and then reverses to pass it to the second skin, as it completes the fleshing process of this part. The second system operates in the same way and deposits the skin on a belt conveyor.

This machine fits ideally in an automated flow line. It eliminates all heavy manual labour. (10pp)

Neutralising mineral-tanned leather, esp. chrome leather - with alkali salt of polymer contg. carboxyl gps.

BENCKISER-KNAPSACK 15.02.80-DE-005699

A97 (20.08.81) C14c-03/04

15.02.80 as 005699 (510DJ)

Leather tanned with minerals is de-acidified and/or neutralised by using alkali salts of polymers contg. COOH gps. as acid-binding and/or acid-exchanging agents.

The leather is partic. chrome leather. Alkali salts of (co)polymers from (meth)acrylic acid, maleic acid, or hydroxy-acrylic acid are used. The mol.wt. of the polymer is 1,000-30,000 (2,000-15,000), esp. 4,000-8,000 for polyacrylic acids. The salts are used as 10-50 (20-40)% solns. The solns. are brought to pH 4-10 (6-8) by addn. of an alkali, e.g. NaOH, KOH, or Na₂CO₃.

The treated leather is more alkaline than the bath in which it was filled. Acid-exchange is quant. Dye uptake is improved without the use of levelling agents, and Cr-dye reactions are prevented. Non-uniform uptake of anionic dyes and fatty substances is retarded, and better distribution is ensured. Rinsing before and after neutralisation is not necessary. Soft leather with very fine grain can be obtd. (13pp)

Cosmetic and dermatological shaving aid has pH 2-7 and contains (a) 0.5-25% cationic organic cpd. (A) with at least one quat. ammonium gp.; (b) 1-20% animal and/or vegetable proteins (or hydrolysates, condensates or derivs.); (c) 0.01-15% nonionic or ampholytic surfactants; and (d) 1-50% wetting, hydrating and supergreasing agents. The compsn. is free of soap, anionic polymers and anionic surfactants.

Opt. ingredients include 0.5-10% protective and gelling colloid; 0.05-3% preservative; 0.05-3% antifoam; 0.5-20% lubricant and anti-dehydrating agent (B), plus (to make 100%), solvents, pigments, dyes, fillers, perfume and colour.

chloride copolymer or quat. hydroxyethylcellulose. (A) forms a thin, protective, lipophilic film over the skin, preventing damage by the razor, and also improving wetting of the hair and dispersing accumulated static charge. (29pp)

FABR★ D21 62732 D/35 ★FR 2473-310
Stable extracts of henna - free from nitrogenous materials, suitable for use as dye for hair

FABRE P SA 15.01.80-FR-000808
E24 (17.07.81) A61k-07/06 A61k-35/78
15.01.80 as 000808 (520DJ)

Stable extracts of Lawsonia inermis (henna) that are free from all nitrogenous materials such as amino acids and proteins, are new.

The extracts are obtd. by either of the following routes: (1) (a) extraction of henna leaves in an acid medium using a solvent of low polarity which does not dissolve nitrogenous materials; (b) extracting the product from (a) into aqueous alkali; (c) acidification and extraction with a solvent of low polarity; (d) sepn. of the dye from the extract from (c), or (2) (a) extraction of henna leaves with a polar solvent; (b) in an acid medium, extracting the extract from (a) using a solvent of low polarity which does not dissolve nitrogenous materials (c) sepn. of the dye from the extract from (b).

Suitable solvents of low polarity are 3-10C ketones, 1-30 chlorinated solvents, aromatic hydrocarbons, and 3-10C ester and ethers. Suitable polar solvents include water, which may be alkaline, 1-4C alcohols, and their mixtures.

Used for dyes, esp. for the hair, cosmetics, and therapeutic preparations. The elimination of nitrogenous material stabilises the lawsone (2-hydroxy naphthoquinone) content of the extract, hence this has a stable dyeing power. (11pp)

Alkaline protease M3 from *Streptomyces globisporus* ATCC 21553 useful as glucosyl-transferase inhibitors for preventing dental caries

DAINIPPON PHARM KK 24.01.80-JP-007557
B04 (D16) (26.08.81) A61k-07/28 C12n-09/52
1.01.81 as 001793 (1248RH)

Alkaline protease M3 is new. It (a) hydrolyses casein and inhibits the activity of glucosyltransferase; (b) it has an optimum pH range of 9-12.5 (substrate casein) and in buffer at pH 4-9 at 37 deg.C for 6 days, at least 50% of the protease activity is retained; (c) it has an optimum temp. of 65 deg.C (substrate casein) and in aq. soln. heated at 55 deg.C for 10 mins. it is stable, while at 60 deg.C there is 50% inactivation and at 65 deg.C there is 90% inactivation.

The protease activity is completely inhibited by N-tromosuccinimide at 10 to minus 4M but not by iodoacetic acid, isopropyl fluorophosphate, EDTA or FeSO₄ at 10 to minus 3M. The protease has an isoelectric point of about pH 9.5 and a molecular wt. of 1.7 times 10 to 4.

The protease has good activity in inhibiting dental caries because of the glucosyltransferase inhibitory activity, and so it is included in toothpastes, toothpowders and other oral hygiene prods. e.g. at 0.001-5% concn. (18pp)

MITU ★ D21 63070 D/35 ★ J5 6084-798
Pocket soap prodn. - contg. alkali salt of fatty acid and starch and/or cellulose

MITSUBISHI CHEM IND KK 14.12.79-JP-162476
A07 (10.07.81) C11d-09/22
12.79 as 162476 (126AT)

New soap compsn. contains 10-40wt.% alkali metal salt of fatty acid and 90-60wt.% starches and/or celluloses.

Pref. alkali metal salt of fatty acid is Na or K salt of 12-18C fatty acid e.g. lauric, myristic, palmitic or stearic acids, etc. Pref. starches are corn, wheat or potato starch, or processed starch e.g. hydroxypropyl starch, etc. Pref. celluloses are natural cellulose, cellulose ester or ether e.g. crystalline cellulose obtd. removing the amorphous components of natural cellulose, methyl cellulose, carboxymethyl cellulose, or hydroxyethyl cellulose etc. Suitable additives e.g. sugars, surface active agent, and inorganic fine powders e.g. Al silicate, Ca phosphate, etc. may be used in combination. The soap compsn. of this invention is suitable to the prodn. of tablets which is convenient as a pocket soap. It can be easily tableted by the direct compression moulding of the powder since its mouldability is superior. Due to satisfactory crumbling resistance and hardness, there is no fear of causing crumbling while it is pocketed. (3pp)

LOY ★ D21 63199 D/35 ★ J5 6086-113
Air conditioning compsn. - contg. alpha-olefin polymer, methyl polysiloxane, emulsifier and water

19.12.79 as 164096 (22RH)

Cosmetic compsn. which contains pearl barley powder. The pearl barley is powder of seed of *Coix Lachryma-jobi* Linne var. *ma-yuen* Stumpf and this contains water, protein, fat, starch, and ash. The present cosmetic composition shows good cosmetic activity to the skin.

For instance, 32% starch, 32% flour, 20% pearl barley powder, 15% defatted milk, 1% lecithin and suitable amt. of perfume are homogeneously blended. The resulting compsn. is useful as cleansing compsn. The above compsn. is used in form of slurry or paste. (2pp)

TAKE/ ★ D21 63436 D/35 ★ J5 6087-514
Compsn. for accelerating hair growth - contains dithioglycolic acid or its deriv. and opt. hydroxy fatty acid, etc.

TAKEDA I 19.12.79-JP-164027
E16 (16.07.81) A61k-07/06

19.12.79 as 164027 (22WB)

Compsn. contains dithioglycolic acid or its salt or deriv. and has pH value of 2 to 6. The amt. of dithioglycolic acid or its deriv. used is 0.1 to 5 wt/v%. There may also be incorporated alpha-hydroxy fatty acid such as lactic acid and glycolic acid. The salt includes the sodium, potassium, or ammonium salt, etc. The compsn. may contain propylene glycol, glycerine, sorbitol, etc. as thickening agent.

Typically, 1 g dithioglycolic acid, 1 g ammonium dithioglycolate, 0.1 g menthol, 0.001 g mustard tincture, 0.01 g pyridoxine hydrochloride, 1 g propylene glycol and 0.5 g perfume are blended and dissolved in 100 ml ethanol. (2pp)

Title compsn. contains 1-40% Na, K, NH₄, monoethanolamine or diethanolamine hydrogensulphite or sulphite as main ingredient, 5-70% ethylene carbonate or propylene carbonate as accelerator, and other additives such as water, etc.

The compsn. is used together with a compsn. contg. water-soluble calcium salt such as calcium acetate, etc. (J51029234) (5pp)

KURS D21 18156 A/10 = J8 1033-363
Adhesives for teeth and bone - comprise a hardener comprising peroxide, amine and sulphate salt and a radical-polymerisable monomer

KURARAY KK 31.08.76-JP-104772
A96 E19 + P31 P32 (03.08.81) *DE2739-282 + A61f-01 A61k-06
31.08.76 as 104772 (367AT)

Adhesives for human hard tissue comprise (a) a radical-polymerisable monomer and (b) a hardener comprising a peroxide, or amine (or amine salt) and a sulphonic acid salt (I). Component (a) pref. comprises one or more (meth)acrylate esters. The peroxide an amine (or amine salt) and a sulphonic acid salt (I). Component (a) pref. comprises one or more (meth)acrylate esters. The peroxide is pref. a diacyl (esp. benzoyl)peroxide. The amine is pref. a sec. or tert. aromatic amine. (I) is pref. an arylsulphinate (esp. benzenesulphinate) salt.

The adhesives are esp. useful as dental fillings, but can also be used on bone, e.g. to treat cpd. fractures or fix artificial joints. The adhesives have a higher bonding strength (up to 100kg/sq. cm) and set more rapidly than similar compsns. contg. peroxide/amine hardeners, and are more stable than compsns. contg. peroxide/sulphonic acid hardeners.

A typical compsn. comprises methyl methacrylate, ethylene glycol dimethacrylate, polymethyl methacrylate N,N'-di(2-hydroxyethyl)-p-toluidine, p-toluenesulphonic acid and benzoyl peroxide. (J53030193) (5pp)

KAOS D21 54669 Y/31 = J8 1033-364
Transparent hair rinsing compsn. - contg. quaternary ammonium salt, fat and oil component and amphoteric surfactant

KAOSOAP KK 15.12.75-JP-149273
E16 (E14) (03.08.81) *J52072-834 A61k-07/08
15.12.75 as 149273 (5HM)

Transparent hair-rinsing compsn. contains as essential ingredients, (A) 0.1-10.0w/w% quat. ammonium salt(s) of formula NR₁R₂R₃R₄ + X-(I); (B) 0.1-5 w/w% of fat and oil composed of 1 or 3-20C aliphatic higher alcohol, polyoxyethylene-alkylether having 1-4 added molar number of ethyleneoxide and contg. 8-20C alkyl gp., lower alkyl ester of 12-20C higher fatty acid, lanolin and liq. paraffin and (C) 0.1-13 w/w% of amphoteric surfactant(s) of formula + NR₅R₅R₇(CH₂)mCOO- (II), N + R₅R₆R₇(CH₂)mSO₃- (III) and/or R₅CON- N + R₆R₇R₈ (IV).

In the formulae, (hydroxy) R₁-4 are alkyl or benzyl. One or two of R₁-4 should be 8-20C alkyl or hydroxyalkyl and the remaining 1-3C alkyl, hydroxyalkyl or benzyl. R₅ is 8-18C alkyl or hydroxyalkyl. R₆-8 are 1-3C alkyl, hydroxyalkyl or benzyl, m is 1-4.

The compsns. are transparent throughout their prepn. and application and can give softness, smoothness and antistatic property to hair. (J52072834) (6pp)

YAMA/ D21 88144 A/49 = J8 1033-370
Dental sealing composition - contg. a strontium cpd., a zinc cpd. and tannin

YAMAGAR 27.05.77-JP-062391

Mixt. of liq. methyl methacrylate monomer - and powdered poly:methyl methacrylate used as surgical bone cement

BRISTOL MYERS CO 20.02.80-US-122896
A96 G03 (A14) (26.08.81) C081-33/12 C09j-03/14
19.02.81 as 005225 (1473AT)

An acrylic bone cement compsn. (I) comprises (a) a liq. monomer and (b) a polymer powder. Ratio of (a):(b) is 1:2 (vol/wt.) where (a) is in ml. and (b) is in g. (a) comprises methyl methacrylate monomer and (b) comprises (i) 80% polymethylmethacrylate powder, (ii) 5-15% polymethylmethacrylate powder beads and (iii) a dispersion of 1.8-2.2% high modulus graphite fibres, 85-95% of (i) has a max. average size of 25 microns and beads of (ii) will fall through a 40 mesh, but not through a 100 mesh. Fibres of (iii) have a dia. of 6-15 mic's. and a length of 0.79-7.14mm. within (b), which is to be dissolved in (a) when ready for mixing, (ii) are milled to roughen and break up the surface of the bead. When (a) and (b) are mixed, resulting (I) has viscosity of 1500 poise at 20 deg.C for 6 mins. after mixing and becomes completely hard in 10-11 mins.

The cement is fluid enough to be used in a bone cement injector gun, maintains a low viscosity for a longer period of time than standard pseudoplastic cements and creates a secure interlock at the cement/bone surface. (5pp)

Heat-resistant fluid absorbent - prepd. by polymerising acrylic monomer in presence of surfactant and water-soluble polyhydric alcohol, and heating and drying

NIPPON SHOKUBAI KAGAKU 11.12.79-JP-159823
A96 P21 P34 (A14) (10.07.81) A41b-13/02 A611-15 B01j-20/26
C081-33/02

11.12.79 as 159823 (55DJ)

Absorbent is produced as follows: an acrylate type monomer (C) which consists of 10-40 mol% of acrylic acid and 60-90 mol% of alkali metal acrylate is polymerised in an aq. soln. of at least 30wt.% in the presence of a water soluble and/or water dispersible surfactant (A) and water soluble polyhydric alcohol (B) so that it becomes gel-state hydrated polymer, then the obtd. polymer is heated and dried so that an absorbent consisting of alkali metal polyacrylate bridged polymer is obtd.

The ratio of (A) and (B) to (C) is 0.01-10pts.wt. and 0.005-20 pts.wt. respectively to 100 pts.wt. of (C).

The absorbent can be widely used for sanitary napkins, paper diaper etc. It can be produced industrially and relatively cheaply. It does not contain any impurities such as organic solvents or inorganic salts. (8pp)

DAIK ★ D22 63002 D/35 ★ J5 6084-833
Shaped adsorbent for treating waste gas - obtd. by mixing asbestos fibre with active carbon and shaping to honeycomb structure

DAIKIN KOGYO KK 13.12.79-JP-162346
J01 (10.07.81) B01j-20/28

13.12.79 as 162346 (51KB)

The body is produced by mixing an asbestos fibre with active carbon of 0.053-0.149mm particle size to obtain a mixt., shaping the mixt. to a paper type substance of below 300 g/sq.m., and shaping the substance to a honeycomb type structure.

In an example, 29g of asbestos was mixed with 29g of active carbon powder to obtain a mixt. The mixt. was shaped to a paper type substance of 0.25mm thickness. The paper type substance was press-shaped to obtain a wave type substance. The wave type substance was concentrically rolled to obtain a honeycomb type adsorbing body. Air is introduced with a blower through a pipe into toluene of a bomb. The air contg. toluene is introduced through a pipe into a honeycomb type adsorbing body to remove toluene from the air. (4pp)

Liq.-absorbent polymer prodn. - by reacting cationic polysaccharide and anionic polysaccharide

KOHJIN KK 14.12.79-JP-161525
A11 P32 (A96) (10.07.81) A61f-13/18 C08b-15 C08b-31 C08b-37
14.12.79 as 161525 (78HM)

Prodn. of absorbent comprises reacting cationic polysaccharide (I) with anionic polysaccharide (II) to produce polymer high in liq.-absorbing power. The polysaccharide is pref. natural polysaccharide (deriv.). (I) is pref. (glycol) chitosan or cellulose deriv. e.g. aminocellulose. (II) polysaccharide is pref. vegetable gum, Na alginate, pectic acid, heparin, carboxymethylated starch, sulphonated starch or cellulose deriv. e.g. CMC. After mixing and reacting (I) aq. soln. with (II) aq. soln., hydrophilic solvent selected from (m)ethanol, isopropanol and Me_2CO is added to the soln. and the ppte. is sepd. and dried. The (II) aq. soln. and (I) aq. soln. are mixed and reacted to obtain compounded matter and the mixed soln. is dried to obtain concd. liq. or powdery compsn. contg. the compounded matter. The high mol compounded matter pref. consists of xanthane gum and chitosan, glycol chitosan or cellulose deriv.

The absorbent is high in absorbing power and safety. It is easy to decompose and is useful for sanitary napkins and paper diapers. (6pp)

Secondary pollution-free deodorant prodn. - by mixing satd. liq. sulphate soln. with ppte. from acid clay, calcium chloride and sulphuric acid, and treating with kainite extract

SANKO SANGYO KK 15.12.79-JP-163298
P34 (11.07.81) A611-09/

15.12.79 as 163298 (117DJ)

A deodorant is obtd. from a series of a closed system process comprising a process in which iron sulphate is satd. at 80 deg.C in water, cooled, and then filtered to obtain the first liq. process in which the main components of kainite ore are extracted by a satd. soln. of kainite at 80 deg.C and then the extract is filtered to obtain the second liq.; a process in which acid clay and calcium chloride are treated with a 10% sulphuric acid soln. and then filtered to obtain ppte.; a process in which

which the second liq. is cooled to 50 deg.C and then mixed with the third liq. with stirring to obtain a deodorant contg. iron phosphate as the main component and traces of inorganic components such as Ca, Al, Na, Mn, Cu, etc.
The deodorant has a great power to deodorise offensively odorous substances present in sewage, garbage, etc., effectively and quickly without causing any sec. pollution. (3pp)

DSH ★ D22 63194 D/35 ★ J5 6086-106
Synergistic slime controlling mixt. - comprising 4,5-di:chloro-1,2-dithiol-3-one and 2 bromo-2-nitro:propane-1,3-di:ol
YOSHITOMI PHARM IND KK(KATA-) 14.12.79-JP-163327
C03 (13.07.81) A01n-33/18 A01n-35/02
12.79 as 163327 (5DJ)
Slime-controlling agent contains (a) 4,5-dichloro-1, 2-dithiol-3-one and (b) 2-bromo-2-nitropropane-1,3-diol as the effective ingredients.
Even if 2-bromo-2-nitropropane-1,3-diol(b) is decomposed, the 1m. decomposed product bromonitroethanol also shows strong sterilising effect. The synergistic effect can be attained at using a component (a) and (b) with the weight proportion of (a):(b) is greater than 1 pref. 1:4-6.5. The slime-controlling agent can be used by dissolving the components (a) and (b) in hydrophilic solvent and adding surfactant in the soln. Thus obtd. slime-controlling agent is added in water so that the concn. of effective ingredients is several ppm.
The components (a) and (b) show the synergistic effect and the slime-controlling agent shows strong sterilising effect durably with smaller application dosing compared with conventional slime-controlling agent. (6pp)

03.78 as 022845 (108AT)
Deodorant contains as active components abietic acid, its alkali metal salt, its organic base salt, its ester or its amide. In an example, 4 g. of abietic acid, 40 g. of polyoxyethylene oleyl ether 155 ml. of water are mixed to prepare the deodorant.
The active component has a good deodorising effect against substances such as formalin, pyridine and hydrogen sulphide. The present deodorant is safely handled and can be prepared at low cost.
Abietic acid is found in natural resin such as rosin and dammar, and can be extracted. Its derivatives include esters with methanol, ethanol, hydroxyethanol, hydroxyethylsulphonic acid, hydroxyacetic acid, polyethylene glycol; amides with ethanol amine, diethanolamine and glycine; alkali metal salt and organic base. Examples are ethanolamine salt, methyl ester, sodium salt, ethyl ester, glyceride, ethanolamide, ethanolamide and polyoxyethylene ester. The water-soluble ester cpd. is used in the form of an aq. soln., and is made water-soluble using a solubilising agent such as polyoxyethylene glycol ether and then used in the form of aq. soln. Further, the ester cpd. can be used in solid form such as powder. It is possible to add diluent such as kaolin or talc. (J54117031) (5pp)

Inhibition of sulphate-reducing bacteria growth in oil strata - using mixed hydrogen, chlorine and hypochlorite from salt soln. electrolysis

VOLG PETRO IND INST(NIZH =) 05.10.78-SU-671055
H01 Q49 (17.12.80) E21b-43/22
05.10.78 as 671055 (835VE)

Sulphate-reducing bacteria growth in the oil-bearing strata is completely suppressed by electrolysis salt water forced into the well, so that Cl₂ enters the stratum. The antibacterial treatment efficiency is improved by mixing all the hydrolytic products, H₂, Cl₂ and NaOCl, for despatch into the stratum. Apart from Cl₂ and NaOCl, H₂ is also an effective bactericide.

By using all the products of electrolysis, the electrolytic equipment is simplified and casing columns or pump-compressor tubes can be used as cathodes, with a single cable current carrier. The anode is a graphite cylinder, 27 mm. by 330 mm. It was shown that 2 mg/l Cl and NaClO killed the bacteria completely in a vol. of 150 cu.m. Treatment is conducted for 6 hrs., using 25 cu.m./hr. salt water and a 60A current. Bul. 45/7.12.80 (2pp)

Detergent compsn. - contg. opt. quaternised poly:amine cpd. prepd. by reacting hydroxyalkyl-amine with benzyl chloride and reacting with alkylene oxide

NIKKA KAGAKU KOGYO 18.12.79-JP-163459

E14 (15.07.81) C11d-01/62 D06l-01/12

18.12.79 as 163459 (126DT)

A detergent compsn. contg. at least one cpd. of formula and/or a quat.ammonium compd. obtd. by quaternising it. R is an ethylene group or propylene group; l is between 2 and 1000; m is 1 to 4; and n is from 1 to 3.

(I) is obtd. by allowing an amine cpd. having a hydroxyethyl or a hydroxypropyl group with benzyl chloride to prepare an amine cpd. having a substd. amine group, and adding alkylene oxide to the amine deriv. The cpd. can be quaternised with dimethyl sulphate or benzyl chloride. Pref. amine cpd. used as the raw material for the reaction is (di)ethanolamine, aminoethyl ethanolamine, etc. Pref. alkylene oxide is ethylene oxide or propylene oxide.

Since the detergent of this invention has superior detergency compared to prior detergent compsn., the amt. to be used in the detergent compsn. can be reduced. The superior detergency of the detergent compsn. may be attributed to its superior affinity to dyestuffs capable of extracting the molecules of the dyestuff in the liq. and its superior solubility for the molecules of the dyestuff and superiority of the dispersivity for the dirt component. (5pp)

NIOF ★ D25 63357 D/35 ★ J5 6086-
Detergent compsn. - contg. N-polyoxyalkylene fatty acid amide and anionic or nonionic surfactant

NIPPON OILS & FATS KK 17.12.79-JP-162844

A97 E16 (A25) (15.07.81) C11d-01/66

17.12.79 as 162844 (126RH)

A detergent compsn. is claimed contg. the following surfactant components (A) and (B) in (0.05-2)/1 wt. ratio: (A): polyoxyalkylene fattyacidamide of formula RCONR'-(CH2CH2O)nH (where R is 7-21C alkyl; R' is H or CH3, R is H or CH3; n is 15). (B): one or more anionic or nonionic surfactant. synergistically increased detergency is obtd. by the use of (A) a detergent compsn. having superior resistance to hard water also obtd. Softness of the washed prod. is not spoiled even by repeated washing using compsn. (6pp)

LIOY ★ D25 63358 D/35 ★ J5 6087-0
Liq. detergent compsn. - contg. anionic surface active agent, amine oxide, alkali metal halide and inorganic salt

LION CORP 18.12.79-JP-164356

E37 (E16) (15.07.81) C11d-01/02 C11d-03/02 C11d-10/02

18.12.79 as 164356 (126AS)

Compsn. comprises (a) 5-40 wt.% anionic surface active agent; (b) 1-10 wt.% amine oxide; (c) 0.5-5 wt.% alkali metal halide; and (d) 0.04-1.5 wt.% of at least one inorganic salt selected from sulphites, phosphates, and thiosulphates.

Pref. the amine oxide is of formula (I) (where R1 is 10-20C n-alkyl branched alkyl and R2 and R3 are each (m)ethyl. Inorganic salt is pref. an alkali metal salt.

Since the compsn. contains mono-long chain alkyl amineoxide in addn. to an anionic surface active agent, its detergency is superior and its effect to the skin is mild. Alkali metal halide improves preservative properties and inorganic salt component acts as a corrosion inhibitor. (4pp)

COLG D25 40484 D/23 = US 4283-1
Carboxamide N-substd. with long-chain sec. aliphatic hydrocarbyl gp. - used as non-yellowing antistatic agent in textile washing compsn.

COLGATE PALMOLIVE CO 26.11.79-US-097467

E16 F06 + P43 (11.08.81) *DE3043-618 C11d-03/32 D06m-13, + B08b-03

26.11.79 as 097467 (393HM)

Antistatic compsn. for laundering fabrics comprises 2-25 wt. carboxamide antistatic agent of formula (I); RNHCOR' (where R is sec. aliphatic hydrocarbon contg. at least 8C and R' is H or 1 alkyl) and anionic, nonionic, ationic, ampholytic or zwitterionic agent.

Pref. the compsn. also contains optical brighteners and builders and (I) is absorbed on a carbonate base bead comprising Na16C03, Na2CO3 and silicate solids.

(I) are non-yellowing and do not reduce optical brightening performance of the compsn. (8pp)

UNIL D25 27738 C/16 = US 4283-1
Particulate alkaline detergent contg. tri:poly:phosphate - act. to spray-dried powder of other components, giving reduced deposition in washing machines

LEVER BROTHERS CO 03.10.78-GB-039074

A97 E34 (11.08.81) *EP---9-952 C11d-03/06 C11d-11 + C11d-17/06

01.10.79 as 080845 (937NS)

Particulate alkaline detergent compsn. contg. at least 5% by wt. synthetic detergent active cpd. or its mixt. at least 5 % by wt. alkali metal tripolyphosphate pref. of Na and 3-10% by wt. alkali metal orthophosphate pref. monosodium dihydrogen disodium monohydrogen or trisodium or the phosphate or mixt. and no more than 2.5% by wt. alkali metal pyrophosphate prep. by spray drying a detergent base powder contg. some or all of the detergent active cpd. or cpds. and some or all of alkali metal orthophosphate and admixing at least 5% by wt. of alkali metal tripolyphosphate in particulate form with spray dried powder with the remainder if any of alkali tripolyphosphate being spray dried in the base powder.

The compsn. contains total amt. of tripolyphosphate and orthophosphate is 15-25 % by wt. The compsn. reduces inorganic deposits on heater elements and other surfaces of washing machines. (6pp)

UNIL D25 06715 D/05 = US 4283-302
Particulate bleaching compsns., esp. washing powders - contg. tetra:acetyl ethylene-di:amine activator of specified granulometry

LEVER BROTHERS CO 06.07.79-GB-023765
E16 (11.08.81) *BE-884-208 C11d-07/54
07.07.80 as 166639 (937NS)

Particulate bleach compsn.comprises 3-99.5% by wt. particulate inorganic peroxy bleach cpd. pref. sodium perlorate and 0.25-50% by wt. tetraacetyl ethylene diamine (TAED). The TAED has a particle size distribution as determined by sieve analysis of 0-20% greater than 150 microns 10-100% between 100-150 microns, 0-50% less than 75 microns and 0-20% less than 50 microns. The TAED is contained in granules in combination with granulating agent pref. of Na and K triphosphate mixt. giving a granule size of 100-2000 microns and comprising 10-99% by wt. TAED. Pref. the compsn. contains 0.05-5 % by wt. stabilising agent chosen from ethylenediamine tetra(methylene phosphonic acid, diethylene triamine penta methylene phosphonic acid their water soluble salts.

The compsn. is in low temp. bleach which does not suffer from significant sedimentation and/or dissolution problems neither suffering decompsn. problems during storage. (6pp)

Arrangement of Abstracts

'MAJOR' COUNTRIES – An alerting abstract of every basic document is provided, and of examined equivalents from West Germany, Great Britain, Japan, the Netherlands and the United States, and granted and unexamined European and unexamined PCT equivalents. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry	F	Textiles, Paper, Cellulose
AE	Polymer & General Chemistry	G	Printing, Coating, Photographic Chemistry
A+	Polymer Applns.	H	Petroleum

DERWENT PATENTS SERVICES

1981 INSTRUCTION CLASSES REGISTRATION FORM

A round of Derwent instruction classes, to be held during September, October and November 1981, will be of very special significance to both new *and* existing users.

The Syllabus of classes is as follows:

Elementary A Coding (IC2)

A two day course for new users of CPI Section A codes, covering basic principles and discussion of examples. Max. 20 participants.

Elementary BCE Coding (IC3)

A two day course for new users of CPI Sections BC & E codes with special reference to the New Chemical Code, again with discussion of examples. Max. 20 participants.

Advanced A Coding (IC4)

A two day course for those with previous training and experience of the CPI Section A codes. Max. 20 participants.

Advanced BCE Coding (IC5)

A two day course for those with previous training and experience of CPI Sections BC & E codes, with special reference to the New Chemical Code and coverage of complex examples. Max. 20 participants.

**Online User Instruction
and General Overview (IC6)**

A one day course giving in-depth treatment of all access points except special coding, together with formulation of strategy and "hands-on" experience. A general overview of Derwent and its Patents products will also be given. Max. 20 participants.

**Advanced Online
Searching (IC7)**

A one day course demonstrating the use of special coding concepts and other parameters in the formulation of search logic to retrieve specific subjects or chemical structures. Max. 10 participants.

Cost per person for these classes is: IC2 through IC5 £60 or \$130; IC6 and IC7 £40 or \$90.

D11: BAKING

KUHL/ ★ D11 64228 D/36 ★DD-148-713
Multideck baking oven charging device - with shearlegs lifting table and roll/off roll/on frame controlled by push buttons

KUHLMANN M 28.01.80-DD-218678

(10.06.81) A21b-03/04

28.01.80 as 218678 (39HM)

A charging device, for a multi-deck baking oven for handling dough mouldings, e.g. for backing of loaves of bread and crusty rolls, is a shear-leg lifting table with a plywood top on which an electromechanical chain drive can reciprocate a roll-off roll-on frame. All movements are controlled by a push button control panel.

This saves the heavy labour of manual oven charging operations. The device is of simple design and takes up little space. (13pp)

MILC- ★ D11 64273 D/36 ★DE 3005-866
Ready-to-bake curd mixt. for cheese-cake prepn. - contg. fresh cottage cheese and cheese, fresh eggs, sugar, starch mixt. and flavouring

MILCHWERKE REGENSBU 16.02.80-DE-005866

(27.08.81) A21d-10/02 A23c-19

16.02.80 as 005866 (200DJ)

In the prepn. of a stable, ready-to-bake curd mixt. for cheese cake, a specially treated fresh cheese is added to fresh cottage cheese and worked to a mixt. together with sugar, starch mixt., stabiliser mixt., flavouring materials and fresh eggs. During working pH 4.5-4.6 is set with an organic acid. Mixt. dry solids content is kept at 29-31%. The constituents are mixed homogeneously in a mixer and the compsn. is heated to 70 deg.C while maintaining a constant dry solids content.

The curd mixt. remains fresh and moist for a long time, to give a high-quality cheese-cake. (8pp)

WERN ★ D11 64340 D/36 ★DE 3046-029
Dough moulding machine - with turnover bottom mould on endless chain for change of dough shape

WERNER & PFLEIDERER 14.01.80-AT-000166

(27.08.81) A21c-09/08 A21c-11/06

06.12.80 as 046029 (39DJ)

A moulding machine to produce at least two different shapes of dough, for example crusty rolls of different size, is fitted with an endless chain carrying the bottom mould to a punching machine with the top mould. The bottom moulds are hinged to the chain. At one point, their support can be shifted and a slider is used to turn the mould through 180 deg. if each side carried a different cavity.

An endless chain carries the bottom moulds which have two different shapes of cavity and are hinged at the centre. During normal operation with the corresponding top mould, operated by the punching machine, the moulds are supported by guide rails. If the shape has to be changed, the section is moved sideways by a pull rod so that a profiled plate turns the bottom mould through 180 deg.

This facilitates a quick change in the production runs of bakeries. (12pp)

HAAS/ ★ D11 64588 D/36 ★GB 2069-824
Wafer baking compartment with lateral sealing strips - formed with gap connected to compartment for baking of excess dough

HAAS F 27.02.80-AT-001086

(03.09.81) A21b-05/02

28.02.81 as 006042 (295AT)

A wafer-baking compartment comprises two plates located one above the other. A lateral seal consists of two strips which are each fastened to one of the plates and which define between them a gap resembling a baking compartment. Steam ducts extend into the strip and provide communication between the wafer-baking compartment and the gap.

Pref. the gap is offset downwardly relative to the baking- face of the lower plate. The gap is pref. inclined relative to the baking plates at 0 to 85 degs.

Excess dough passes through the steam ducts into the gap where it is baked and is therefore easy to remove at the end of the baking process. (5pp)

Bread loaves orienter - has chute bottom step above pivot of free lever bounding gap with chute side

FOOD IND PLANTS DES 01.02.79-SU-721544

Q31 (15.12.80) B65b-35/56

01.02.79 as 721544 (89WD)

The reliability of bread loaf orienting mechanism is enhanced by preventing jams at the step of the chute. The bottom of the latter, below the step, features a transversely moving lever 5 freely pivoted on stud 4 beneath the step. The longitudinal plate 3 is fixed between the trough and the lever and its top edge is chamfered towards the lower end of the lever.

The lever 5 has a longitudinal cross-section matching one and half of the length of handled loaf 7 while its width corresponds to the width of the step in the chute. The loaves slide down by gravity towards the support wall 6 of the chute I and reach the gap between that wall and the bottom step. Further advance deflects the lever 5 which maintains the correct position of the bread loaf. Bul. 46/15.12.80. (3pp Dwg. No.1)

Machine to insert sachet of giblets into drawn chicken - has plunger to drive sachet through funnel positioned over entry to chicken cavity

GEBR STOLLE CO GMBH 22.04.80-DE-015336
(17.08.81) A22c

21.04.81 as 888504 (448BZ)

A process and a machine for inserting a sachet contg. prepared giblets into the cavity of a drawn and cleaned chicken. This insertion is effected while the chicken is suspended by its two legs from a main conveyor.

Each filled sachet is now placed into one of a series of open-ended, downwardly convergent, pref. coned funnels fitted to a second conveyor. The funnel is conveyed to a position immediately above a chicken hanging from the main conveyor. At this point, a plunger is displaced down through the funnel, driving the sachet into the cavity inside the chicken.

Just before the plunger transfers the sachet into the chicken, the narrow end of the funnel is pref. inserted slightly into the entry of the cavity.

The two conveyors are pref. both advanced intermittently and in synchronism, coaxially around a fixed turning station. The station pref. has cam tracks to displace funnel and plunger as the second conveyor moves around the station.

Insertion of sachets of prepd. giblets into drawn chickens ready for distribution or freezing. Mechanisation of labour-intensive operations to reduce prodn. costs. (12pp)

(03.09.81) *BE-866-443 A23b-04/02

20.04.78 as 015596 (1376AS)

In the pickling of meat in liq. brine or dry salt the container is evacuated, an inert or neutral gas is introduced, and the container is evacuated about an horizontal axis. The meat pieces are removed by establishing atmospheric pressure in the container.

The vacuum is pref. applied before the pickling medium is

introduced in the container. Pickling time is reduced. (6pp)

FARH D12 38504 A/22 = GB 1596-922
Moulded objects, esp. packaging materials, including sausage skins - based on plasticised cellulose hydrate and also contg. ester(s) conferring durable plasticisation

HOECHST AG 01.12.76-DE-654427

A11 + Q34 (A25 A97) (03.09.81) *BE-861-282 A22c-13 C081-01/06 29.11.77 as 049632 (945AS)

Shaped article comprises cellulose hydrate (I) and, as permanent plasticiser; at least 5 wt.% based on (I), of an ester (II) of a cpd. having at least 2 OH gps., at least 1 being esterified by a 9-24C aliphatic monocarboxylic acid.

The article also contains water and opt. a secondary plasticiser. (II) is e.g. glycerol mono- or di-stearate or polyethylene glycol mono- or distearate.

The article shrinks little on drying and is sufficiently supple for used partic. as artificial sausage skin. Sausages having such skins can be cut open without tearing, even at relatively low humidity and can be transported without difficulty. (17pp)

FARH D12 38503 A/22 = GB 1596-923
Permanently plasticised modified hydrated cellulose article - esp. sausage skin, prepd. by passing aq. alkaline viscose soln. through perforate plate

HOECHST AG 01.12.76-DE-654418

A11 + Q34 (A25 A97) (03.09.81) *BE-861-281 A22c-13 C081-01/06 29.11.77 as 049633 (945AS)

Mfr. of a shaped article comprising chemically modified cellulose hydrate is claimed. A liq. mixt. of aq. alkaline viscose soln. and a permanent plasticiser for cellulose hydrate, contg. 9-24C aliphatic gp(s) is extruded from a die into a precipitant liq. to produce a formed structure.

This is treated with regenerating and washing liqs, then treated while in gel state with aq. acid soln. of a cyclic urea cpd. having methylol gps. The prod. is heated, dried and opt. moistened with water.

The article has high swelling strength and high mechanical strength due to consolidation by crosslinking. It retains extensibility and is partic. an artificial sausage skin. (11pp)

LEFI- ★ D12 64587 D/36 ★ GB 2069-815
Electrical stimulation bar for animal carcass - movable between sterilising position and carcass engaging position

LEFIELL CO 21.02.80-US-123479

X25 (03.09.81) A22c-09

22.08.80 as 027462 (295RP)

Electrical stimulation is applied to an animal carcass as it is transported along a predetermined path relative to a base. A sterilisation chamber is mounted on the base. An electrical stimulation bar is movably mounted between a first position in which it extends along the predetermined path for contacting the carcass, and a second position within the sterilisation chamber.

Pref. the bar is moved between the two positions by rotation about an elongated actuating shaft, from which it is electrically insulated.

Electrical stimulation produces acceleration of the meat tenderisation by its own enzymes. The method replaces a manual process. (8pp Dwg.No.7)

NNSH ★ D12 64847 D/36 ★ J5 6088-742
 Pasty meat food prodn. - by dispersing gluten in acidic or alkaline water, adding oil and fat, emulsifying, spray-drying and adding emulsion to meat

NIPPON SHINYAKU KK 18.12.79-JP-165318
 (18.07.81) A22c-11 A231-01/32

18.12.79 as 165318 (5HM)
 Method comprises combining powdery oil and fat, prepd. by dispersing gluten in acidic or alkaline water, adding oil and fat to the dispersion, emulsifying the mixt. and spray-drying the emulsion, in meat material. It is possible to increase oil and fat content in the microcapsular oil and fat up to 95% and it is usually combined in amt. above 0.5% pref. above 1% in pasty meat foods.

In preparing pasty meat foods (e.g. sausage, fish sausage, marine pasty food, etc.) animal and vegetable oil and fat is combined to improve the texture and glossiness of the prod. Animal fat of high m.pt. (e.g. tallow, lard, etc.) has been mainly used, but it has had to be combined in meat material at low temp. in order to avoid heat-denaturation of the protein in meat material and the uniform emulsification of the fat has been very difficult. Wheat gluten shows good holding properties for oil and fat and the microcapsular powdery fat obtd. by coating oil and fat with water insoluble gluten, is suitable for combining in meat material. Microcapsular powdery oil and fat can be prepd. from liq. oil and a pasty meat food contg. oil and fat having opt. fatty acid compsn. is prepd. (3pp)

Simultaneous prepn. of fatty acid nitrile(s) and glycerol - by catalytically contacting glyceride(s), esp. natural fats and oils, with ammonia

HOECHST AG 25.03.78-DE-813204 (20.08.77-DE-737607)
E17 (D21 E16) (27.08.81) *EP-----916 C07c-31/22 C07c-120/08 C07c-121/14

16.08.78 as 860715 Based on EPG000916 (068WB)

Mono-, di- and tri-glycerides of formula (I) (where R₁, R₂ and R₃ each are 3-23C (hydroxy)aliphatic hydrocarbon gps.) are reacted with ammonia to obtain fatty acid nitriles R₁(R₂,R₃)-CN and glycerol. The liq. glyceride or glyceride mixt. is put in intimate contact with at least 200 litres of gaseous ammonia, opt. together with an inert gas per kg. glyceride per hour at 220-330 deg.C.

A catalyst is present which is a salt of a carboxylic or sulphonic acid and lead, zinc, cadmium, tin, titanium, zirconium, chromium, antimony, manganese, iron, nickel or cobalt. The resulting reaction mixt. is discharged from the reaction zone and subjected to a phase sepn. into a fatty acid nitrile phase and a glycerol/water phase.

The glycerol formed is removed rapidly from the reaction zone. The reaction mixt. may be fractionated before phase sepn. and any fatty acids or acid amides present recycled. The nitriles and glycerol are obtd. in high yield and of good purity and are useful chemical intermediates. (12pp)

22.01.80 as 001281 (448AS)

Process for demoulding milk prods. partic. soft paste cheeses

from a multi-cavity mould block is described. The block is subjected to vibrations in a direction which ensures that the prods. slide gently out of the mould cavities.

The machine pref. comprises a vibratory frame which has jaws to grip the mould block so that the vibrations are transmitted from the frame to the mould block.

The frame is pref. vibrated vertically by a pair of out-of-balance electric motors rotating in opposite directions. The frame is pref. suspended in a rigid, fixed structure from resilient mountings or shock absorbers.

By an elevator table from an infeed conveyor to a height at which the mould block can be gripped by the frame jaws.

Demoulding, milk prods., partic. soft paste cheeses, from multi-cavity mould blocks. The prods. are extracted without handling, contacting, suction or blowing. Consequently the demoulded prods. are presented without damage and with greatly reduced losses. (10pp)

10.05.78 as 018781 (931AT)

A foodstuff is prepd. by phase sepn. through mechanical frituration or mastication and simultaneous crushing of aliment raw prods. in a closed chamber, at several hundred bars compression.

The chamber has openings through which soft components are extruded due to the pressure, in the form of a mixt. as the main

component of the prod. The frituration, crushing and pressure are carried out by 1 or more punch advancing in the mass contained in the chamber.

The lateral longitudinal face of the punch is formed with grooves allowing the soft prods. to escape through calibrated passages opening in either the chamber or punch wall, or between the punch and the chamber wall. (3pp)

MIMB ★ D13 64565 D/36 ★ GB 1597-088
Prod. of cultured butter from sweet butter - by adding diacetyl, lactic acid and microorganisms

MILK MARKETING BOARD 30.05.78-GB-023745

(03.09.81) A23c-15/12

30.05.78 as 023745 (367AS)

Prod. of cultured butter is carried out by inoculating sweet butter with (i) diacetyl and at least one other aroma cpd., (ii) lactic acid, and (iii) a viable culture of at least one lactic-acid-producing microorganism and at least one diacetyl producing microorganism. Components (i) and (ii) must be added separately from (iii) and must be free of viable microorganisms.

The process allows higher salt contents to be obtd. than the known Dutch process. Salt can be included in component (i) and/or (ii), pref. in an amt. such that the cultured butter contains up to 2wt.% salt. Component (i) is pref. produced by steam distn. of cultured skim-milk. (4pp)

UNBI- ★ D13 64585 D/36 ★ GB 2069-812
Treatment of rice by initial softening - with subsequent pressure application to produce cracks through which flavouring is introduced

UTD BISCUITS UK LTD 27.01.81-GB-002499 (14.02.80-GB-005086)

(03.09.81) A231-01/18

27.01.81 as 002499 (+ 28.3.80-GB-010619) (295BZ)

Rice is partly softened to prevent it from shattering under pressure. Pressure is subsequently applied to the rice to produce cracks. An additive is then applied which impregnates the rice through the cracks. The resultant prod. is heated sufficiently rapidly that puffing occurs.

Pref. the heating produces complete gelatinisation of the prod. The heating may be effected using microwave radiation, deep fat frying, salt bed drying or forced convection heating.

The process can be used to produce sweet or savoury food prods., e.g. a puffed snack which can be formed into rice balls, or a confectionary bar prod. The process gives the rice an open structure and if desired it is virtually instantly rehydratable. It can thus be used in snack prods. rehydratable merely by the addn. of boiling water. (4pp)

CERE- ★ D13 64586 D/36 ★ GB 2069-813
Prod. of foodstuffs, e.g. meat extenders, from comminuted seeds - by softening, compression and impregnation

CEREAL SERVICES LTD 03.02.81-GB-003243 (08.02.80-GB-004326)

(D12) (03.09.81) A231-01/36

03.02.81 as 003243 (367BZ)

Prod. of foodstuffs from comminuted edible seeds is carried out by (a) partially softening the comminuted seeds to prevent shattering under pressure, (b) applying pressure to increase the surface area of the comminuted seeds, and (c) impregnating with an additive. Also claimed is a meat extender comprising a comminuted edible seed prod. in which an additive is incorporated by compression followed by impregnation.

The starting material pref. comprises cut or kibbled cereal (wheat, rice or barley) grains, each grain being subdivided into 2-8 (pref. 3-7, esp. 5 or 6) pieces. In step (b), the softened material is pref. compressed into flakes. (3pp)

MONO- ★ D13 64695 D/36 ★ GB 2070-202
Discharge valve for aerated prod. esp. chocolate - with plunger closing aperture in valve plate having adjustable area

MONO OAKES LTD 04.02.81-GB-003380 (25.02.80-GB-006248)

Q66 (03.09.81) F16k-03/02

04.02.81 as 003380 (295KB)

An aerated prod. is discharged through a valve plate having an aperture which converges downstream. A second valve plate carries a similar aperture but with a divergent taper. The second plate can be slid across the first plate to alter the effective discharge area. A plunger can be moved axially on the upstream side of the valve to enter the aperture of the first valve plate and thereby stop the prod. flow irrespective of the position of the second valve plate. Pref. a piston and sleeve assembly is associated with the plunger to deliver a metered volume of the prod. the the aperture.

The valve discharges aerated chocolate through a sharp-edged aperture to produce a rapid expansion of the prod. The operation of the plunger does not affect the second valve plate and thus the original valve opening is resumed immediately the plunger is

moved away from the shut-off position. (11pp)

HOUS- ★ D13 64698 D/36 ★ GB 2070-217
Prod. of dry fruit chips as snack food - by three-stage drying of fresh fruit chips

HOUSE FOOD IND CO 05.02.80-JP-011997

Q76 (03.09.81) F26b-05/04 F26b-23/08

28.01.81 as 002592 (367BZ)

Prod. of ready-to-eat dry fruit chips from fresh fruit chips with an adjusted water-soluble sugar content of 6-25 wt.% is carried out by (a) freeze drying to a moisture content of 15-60 wt.%, (b) microwave drying under vacuum to further reduce the moisture content to 10-40 wt.%, and (c) vacuum drying to a moisture content below 5 wt.%.

Suitable fruits include apple, peach, melon, apricot, persimmon and papaya. The fresh fruit chips are pref. impregnated with a syrup contg. 5-30% sugar and 0.1-0.5% antioxidant. Suitable sugars are glucose, arabinose, xylose, galactose, fructose, sucrose, lactose, maltose, cellobiose, raffinose, maltotriose, stachyose, dextrin, sorbitol and mannitol.

Step (a) is pref. effected at 0.1 torr and a temp. rising to 30 deg.C; (b) at 15-30 torr and a temp. rising to 30 deg.C, with a microwave output of 4.5kW; and (c) at 10-30 torr and a temp. rising to 50 deg.C.

The products are suitable for eating as snack foods- having a pleasant bite and retaining the inherent flavour of the fruit. (9pp)

SHIM- ★ D13 64848 D/36 ★ J5 6088-750
Treating Japanese radish using hot acetic acid - a calcium salt, aq. phosphoric acid and pressure sterilisation stage, to enable them to be stored for long periods

SHIMIDZU SHOKUHN 21.12.79-JP-165670

(18.07.81) A23b-07/10

21.12.79 as 165670 (5NS)

The method comprises (a) immersing washed Japanese radish in hot acetic acid soln., (b) cutting it in pieces; (c) immersing the pieces in a soln. contg. Ca salt, e.g. Ca lactate, (d) blanching them by heating them with the soln., (e) packaging them in air-tight vessels, (f) pouring aq. phosphoric acid soln. into the vessels to make the pH 4.3-5.2, (g) tightly closing and (h) heating them under pressure for sterilisation.

(a) sterilises microbes and hydrolyses insoluble propectin in the epidermis of the radish partly to soluble pectin. The Japanese radish is softened and penetration of the calcium soln. into the radish is promoted. In (c) soluble pectic acid is reacted with calcium to form insoluble calcium pectate and the tissues of the radish are strengthened. Japanese radish is an important vegetable in Japanese dishes. Its harvesting period is restricted. The plain boiled Japanese radish is preserved, delicious and hardly physically damaged during cooking, and can be stably supplied throughout the year. (3pp)

FUKU- ★ D13 64849 D/36 ★ J5 6088-752
Ethylene adsorbent for keeping vegetables and fruit fresh - obtd. by coating an adsorbent with an oxidising agent for ethylene

FUKUOKA SEISHI KK 19.12.79-JP-167145

(18.07.81) A23b-07/14

19.12.79 as 167145 (5KB)

Agent is prep.d. by coating the surface of adsorbent with the oxidising agent which is not transferred or left on vegetables and fruits and can oxidise the ripening-promoting hormone for vegetables and fruits e.g. ethylene and adsorb the oxidised prod.

When the agent and vegetables or fruits are packaged in corrugated paper box, ethylene gas is adsorbed almost completely within 5-10 minutes. As adsorbent active carbon, activated alumina, etc. can be used and as oxidising agent potassium bromate, other oxy-acid salt, aromatic peroxide, etc. can be used.

The agent has good chemical and physical adsorbing properties, and shows high adsorption of ethylene. It oxidises ethylene and adsorbed ethylene is not released. Its adsorbing capacity is not reduced even in the presence of carbon dioxide gas. (5pp)

SANY ★ D13 64850 D/36 ★ J5 6088-756
Dextranase contg. chewing gum prepn. - by adding sugar alcohol soln. to aq. dextranase soln. then kneading into chewing gum base

SANKYO KK(LOTT) 20.12.79-JP-166231

(D16 D21) (18.07.81) A23g-03/30

20.12.79 as 166231 (5BZ)

Prepn. comprises (a) adding aq. dextranase soln. in the soln. contg. at least one kind of sugar alcohol selected from sorbit, mannitol, maltitol and xylitol, (b) adding the obtd. soln. in the mixt. of chewing gum base and the additives of chewing gum use and (c) kneading the mixt.

Dextranase dissolves in water and it is mixed in the sugar

cohol soln. having sugar alcohol concn. 60-85% so that the dextranase concn. in the mixed soln. is 0.5-2.0%. The obtd. soln. is combined in the mixture of chewing gum base and the additives for chewing gum use so that 100-100000 units of dextranase is contained in 1 g. of obtd. chewing gum. It is assumed that dextranase is included in sugar alcohol during kneading of the mixture and the fall in dextranase activity can be prevented.

Dextran is the major component of the sordes on tooth and dextranase has been attracting attentions as the suppressing agent for the formation of sordes and thus the preventing agent for decaying of tooth. Thus the chewing gum contg. dextranase has been prepared, but the dextranase in it has lost 60% of its activity in 6 months. Using sugar alcohols can prevent the fall in the dextranase activity in chewing gum. (3pp)

Oxygen adsorbent used in food containers etc. - comprises iron powder coated with metal halide and opt. binder and/or alkaline substance

MITSUBISHI GAS CHEM IND 26.08.77-JP-102353

E36 G04 (08.08.81) *J54035-883 A23l-03 + B01j-20/02

26.08.77 as 102353 (117HM)

An oxygen absorbent is prepd by coating 100 pts wt of iron powder with 5-10 pts wt of a metal halide, together with a binder and/or an alkaline substance if necessary, by using a metal halide soln contg binder and/or alkaline substance, and then the coated iron powder is dried until the moisture content becomes upto 1 wt % Metal halide is e.g. alkali(ne earth) metal halide.

The absorbent has a great oxygen absorption capability without defects, e.g. becoming wet on standing, contamination of foods, generation of hydrogen during storage, absorption of atmospheric oxygen during storage, etc. and thus exhibits its great power within a confined container for foods, etc. (J54035883) (4pp)

 Soybean beverage - obtd. by cooking, flavouring and homogenising under pressure
 LOOCS 28.07.72-US-276222
 (08.08.81) *J49042-853 A23l-01/20 + A23c-11/10
 21.10.72 as 105763 (AT)
 The process comprises (a) immersing in water enzymatically active lipid-rich soybean powder (I) contg. about 42% protein 21% fat, 5% ash, 3% fibre, 24% added carbohydrate and 5% water, and (b) cooking, flavouring, and homogenising under pressure to reduce soybean particle size to not more than 10 microns.
 Soybean is washed, pulverised and pressed in a roller mill, and the outer shell is removed by scouring. The material is flaked in a hammer mill, finely pulverised in an Alfin (RTM) mill and graded to give (I) of particle size 270-300 mesh.
 The beverage is nutritious, palatable and can be bottled. It can be prepd. in only 6 stages. Growth inhibiting substances are removed in cooking and sterilisation. (J49042853) (5pp)

NISW D13 17850 D/11 = J8 1034-261
 Soy bean protein extn. - by washing defatted beans in alcohol, evaporating under reduced pressure, treating with hot water and spray-drying liq. extract
 NISSHIN OIL MILLS KK 15.06.79-JP-074741
 (08.08.81) *J56001-854 A23j-01/14
 15.06.79 as 074741 (5NS)
 The method comprises (1) washing defatted soy bean with hydrous alcohol at below 30 deg.C. (2) evaporating alcohol from the washed defatted soy bean at below 30 deg.C. under reduced pressure, (3) extracting the treated defatted soy bean with hot water or ammonia water at 60-90 deg.C. and (4) spray-drying the liq. extract. Aq. ammonia is used so that the mixt. of pretreated defatted soy bean and ammonia water has pH c.a. 8.0. It is desirable to use (b) sulphite in process (1) for improving the solubility of protein in hot water or hot aq. ammonia. The amt. used is 0.5-1.0% of defatted soy bean.
 Even with hydrous alcohol of concn. 50-70 w/w% the colouring matters, the odorous matters and the water soluble sugars in defatted soy bean can be removed. The fall in NSI can be minimised by washing at below 30 deg.C. and the soy bean protein can be extracted in high yield. Soy bean protein excellent in taste and flavour can be obtd. without acid-precipating or neutralising. (J56001854) (6pp)

 Novel acylated cyclohexene of formula (I) (where R₁ is cyano, (acyloxy)methyl, R₂ is lower alkyl, alkenyl, aryl), useful in medicine and food industry, is prepd. by heating at room temp. 3,7-dimethyl-2,6-octadiene of formula (II) (e.g. geranyl acetate, geranyl cyanide, 1-acetoxy-4,8-dimethylnona-3,7-diene) using complex salt of tin tetrachloride with cpd. of formula R₂-COCl (III) (e.g. chloronitril chloride, benzoyl chloride), the cpd. (II) and complex salt are taken in equimolar ratio.
 The reaction is carried out in a solvent such as nitromethane

and methylene chloride. (J51008946) (3pp)

DERC/ ★ D13 65358 D/36 ★ NL 8000-489
Lollipop making machine - transfers them by the sticks so that cooling and direction changes break connecting films on way to packing machine

DERCKX H A J M 25.01.80-NL-000489

(17.08.81) A23g-03/12

25.01.80 as 000489 (1190DH)

The arrangement is for producing lollipops(2) on sticks (not shown) from a continuously extruded length of sugar. The lollipops are formed in cavities in the periphery of a rotating(16) drum(1) which cavities are recessed for the insertion of the sticks.

The lollipops are transferred(21-23) to a series of rotating (17-19) disc pairs(4,5; 6,7; 8,9) which hold them by the sticks so that the gradual cooling combined with the successive changes of direction severs the thin sugar film which still connects adjoining lollipops as they leave the drum. This cooling may be assisted by blowing (cooled) air on the lollipops held by the transfer discs.

This arrangement avoids randomising the lollipops as they leave the drum in order to separate them and re-ordering them thereafter for feeding them into a packing machine. (10pp Dwg.No.1)

Peat-base food for fish prepn. - contg. ammonium nitrate, superphosphate and bran to promote microbial activity

POND FISHING RES 23.03.79-SU-742441
C03 P14 (26.12.80) A01k-61 A23k-01/16

23.03.79 as 742441 (70VE)

Food for fish is prepd. by mixing peat with a nitrogen- contg. substance and superphosphate; the mixt. is subsequently kept for several days in air. The bacterial synthesis of proteins in the peat is intensified by using peat contg. 55-68% of moisture; using NH_4NO_3 ; and adding bran. The wt. ratio peat: bran: NH_4NO_3 : superphosphate is 81:15:3:1 to 83:10:5:2. The air-maturing time is 5-7 days.

The ammonium nitrate used in the above compsn. pref. contains 33-35% of nitrogen. The bran serves as a nutrient for the microflora thus intensifying its proliferation 3-4 times compared with the conventional method. As a result, the temp. of the mixt. spontaneously rises to 55-62 deg. C and, hence complex organic substances present in the peat undergo fermentative splitting yielding easier assimilable fragments. Bul.47/23.12.80. (2pp)

MOGI = ★ D13 65594 D/36 ★ SU-789-087

14.08.78 as 657553 (70VE)

Milk substitute compsn. is improved by using as a source of fat and phosphatides a proteinaceous concentrate contg. 30-38% of fat and 0.6-0.8% of phosphatides, obtd. during the melting of a soft, crude fat. The content of this concentrate is 10-30%, and that of the biologically active substances is 0.04-0.07%; the remainder is milk. The milk base pref. consists of skimmed milk or its mixt. with buttermilk in ratio 6:1 to 9:1.

The title compsn. is produced by pasteurising the milk base, concentrating it, mixing a part of it with the fat base and biologically active substances, admixing the rest of milk and drying. This method is improved by heating the fat base to 50-70 deg. C, and then mixing it with the first part of milk, dispersing, stirring and filtering. The ratio of the proteinaceous fat-

phosphatide concentrate to the first milk part is pref. 1:1. Bul.47/23.12.80. (4pp)

MOMO = ★ D13 65599 D/36 ★ SU-789-092
Protein-enriched soured cream mfr. - from slightly acidified cream and defatted curd, using mesophilic and thermophilic lactic flora streptococci

MOSC MOLOKO PROD 04.09.78-SU-659333
(23.12.80) A23c-13/12

04.09.78 as 659333 (70VE)

Soured cream is produced by normalising cream w.r.t. the fat, introducing a proteinaceous filler, pasteurising, homogenising, cooling to the souring temp. slightly, souring with a lactic acid culture, packing and maturing. This process is accelerated, and the taste and consistency of the product are improved by using as a proteinaceous filler a defatted curd, which is introduced into a slightly acidified cream in a ratio 0.2:1.0 to 0.3:1.0.

The slight souring of the cream is pref. carried out with a preparation contg. mesophilic and thermophilic, lactic acid streptococci in ratio 1:2. The temp. of the proteinaceous filler and the slightly acidified cream is 28-32 and 28-45 deg. C. respectively. The prod. is cooled to 5-8 deg. C, and matured for 6-8 h. Bul.47/23.12.80. (3pp)

In the preparation of pure fats in the dairy ind., the raw material is melted, with increased temp. and hydro-mechanical treatment in order to break down the bonds between the proteins and fats. The fat fraction is subsequently separated, cooled to the temp. at which the fat crystallises out, and the main product is packed. Loss of fat is minimised, the process is speeded up and made continuous, by carrying out the heat and hydromechanical treatment using an injector. The raw material and steam are simultaneously fed through at 150-160 deg. C and 5-6MPa pressure, in the ratio of 1kg of steam to 10kg of raw material. The mixture emerging is instantaneously cooled to the crystallisation temp. (3pp Dwg.No.1)

(23.12.80) A23c-15/14

11.08.78 as 656642 (70VE)

Butter Yaroslavskoe (RTM) is produced by adding a proteinaceous filler to a high-fat cream, normalising the mixt. with respect to moisture and fat, and converting the mixt. into butter by the known method. This process is improved by using as a protein filler an emulsion contg. 39-42.5% of buttermilk, 8-9% of beet sugar and 3.0-3.5% of chicory.

This emulsion is prepd. by mixing dried or concd. buttermilk

with natural buttermilk in such ratio that the solids content is 40-43%. Then beet sugar is added; the mixt. is pasteurised. Subsequently a soln. of chicory in buttermilk is added and the mixt. is emulsified. By this method the biological value and the dietetic properties of the butter are enhanced. Bul.47/23.12.80. (3pp)

Auto control of rotary drum dryer for vegetable prod. - esp. forage regulates drying temp. w.r.t. moisture in final prod.

GEORGES & FILS SA 28.01.80-FR-001822

J08 P15 Q76 (31.07.81) A23n-12/08 A23n-17 A24b-03/04 F26b-21/06 G05d-22/02

28.01.80 as 001822 (448HM)

Process and an installation for automatically controlling a rotary drum dryer used for removing moisture from fresh vegetable prods. are described. The installation is of the type in which the dried prod. is sepd. and fed through a grinder. The drying temp. is now directly related to the moisture content of the final prod. Pref. a moisture content detector is fitted in the grinder discharge passage.

The temp. regulation and the speed of rotation of the drum are continually subject to amendment w.r.t. The powder absorbed by the grinder. The parameter used to determine the grinder power is the measurement of electric current supplied to the grinder. Pref. excess power overrides any downward regulation of dryer temp. and automatically reduces the speed of the dryer to minium.

Controlling a rotary drum dryer for drying veg. prods. such as forage, beetroot pulp and tobacco. Precise control of humidity of final prod. Safety features which include slowing down feed to grinder, maintaining adequate drying temp. and signalling unsatisfactory operation as soon as grinder power rises above set point. (8pp)

Regulation of feedstuff pellet press - involves supplying steam with feedstuff to cascade mixer to reduce power consumption and wear

SOE-PEDERSEN A 05.02.80-DK-000480

P12 P71 (20.08.81) A01f-15 B30b-09/30

28.01.81 as DK0010 (958DH) (E) DK-140303 DE1807142 FR2366929 E(AT CH DE FR GB NL SE)

The process for regulating the temp. of a material conducted to a pellet press involves the use of a volume of steam which is admitted to a cascade mixer (5) with the raw material. The raw material e.g. ground feedstuff is transported from a feed receptacle to the mixer via a dosage worm conveyor (2).

The ground feedstuff exits via a discharge funnel (5) into which a temp. sensor (B) is inserted. The quantity of steam admitted to the mixer is dependent on the temp. in the funnel. The load on the press motor (8) will decrease with the rising temp. until a certain temp. is retained irrespectively of changing motor load. A point will be reached where the motor load will rise rapidly as a result of overloading. This overloading is due to an excess of steam which cannot be absorbed by the feed mixture. This causes the mixture to stick to the press rollers causing the motor to overload. (7pp Dwg.No.1)

 Full water desalination by preliminary water-softening - using
 weakly acid cation exchanger that is regenerated with
 simultaneous waste water neutralisation (CS 31.3.81)

CKD DUKLA 01.02.80-CS-000672
 (27.08.81) C02f-01/42

09.12.80 as 046361 (200)

In full water desalination with simultaneous neutralisation of
 water from ion exchange regeneration, the water is freed from
 Ca- and Mg-ions, before actual full desalination, in a water-
 softening step. A weakly acidic cation exchanger having -COOH
 functional gps. in Na form is used, opt. combined with a strongly
 acidic cation exchanger having -SO₃H functional gps. in Na form.
 When exhausted, the softening step exchangers are regenerated
 in 2 steps; first with acid waste waters from the full desalination
 plant cation exchange step regeneration, and then with alkaline
 waste waters from the full desalination plant anion exchanger
 step regeneration.

The process is used in feed water conditioning for high-
 pressure tanks. Useful cation exchanger vol. capacity is
 increased. Investment costs for neutralisation are reduced
 because the capacious neutralisation vessels are replaced by a
 cation softening step functioning in the full desalination plant.

 Treating manure with Lactobacillus strain and carbohydrate - to
 give bacterial-free prod. useful as cattle feed, landfill and
 fertiliser

BODENRADER B J 20.04.79-US-031905

C04 (26.08.81) *WP8002-282 C02f-03/34

16.04.80 as 900870 Based on WP8002282 (1248WB) (E) US4018650
 US3546812 US3801499 US3900572 US3961078 E(GB)

Treatment of manure includes (1) inoculating the manure with a
 Lactobacillus strain; and (2) mixing it with a carbohydrate (I) to
 lower the pH of the manure to below 4.5. Industrial waste with a
 BOD value of 200-34000 mg/l (based on fermentable carbohydrate
 present) is treated by inoculating with a Lactobacillus strain and
 maintaining the waste at pH 3.8-4.2.

(I) may be any one of a wide range of materials, but it is pref.
 lactose. Pref. Lactobacillus plantarum is used, and the manure is

kept at 32-5 deg.C for the fermentation. The manure prod.
 contains lactic acid and it is suitably contacted with NH₃ so that
 NH₄ lactate is formed, while the N content of the prod. is
 increased.

The manure becomes environmentally acceptable, stabilised
 and free of coliform and pathogenic bacteria. The prod. obtd. has
 potential food value and fertilising capacity. The protein content
 is increased so the prod. is esp. useful for ruminant feeds. The (I)
 may be provided by mixing the manure with industrial wastes,
 e.g. from breweries, distilleries, farms, poultry and food
 processing plants. These wastes can be separately treated with a
 Lactobacillus strain so that they are more suitable for waste
 disposal. The treated manure may also be used as a landfill.

 Continuous digester to produce methane etc. from manure - uses
 ram to displace manure horizontally through fermentation
 chamber

ETAB MAUGUIN 18.01.80-FR-001264

E17 P11 (24.07.81) A01c-03/02 C12p-05/02

18.01.80 as 001264 (448HM)

A continuous digester is for generating methane etc. from
 fermenting manure. The manure is fed into a fermentation
 chamber through which it is displaced in a horizontal direction.
 Displacement of the manure is pref. effected by a ram which is
 moved horizontally across the open bottom of a feed hopper
 which is kept full of stable litter and/or liq. manure. The ram is
 pref. suspended from a support carriage above the digester so
 that no mechanical linkage is fouled by the manure.

The ram is contoured to close off the bottom of the hopper as it
 displaces manure into the chamber. Pref. the manure has to be
 pushed through a sieve to enter the chamber. This prevents
 backflow of manure as the ram is retracted.

A gas outlet from the digester is pref. fitted with a piston which
 can be displaced to break the crust on top of the fermenting

material.

Prod'n. of methane etc. from manure. No need to liquefy and pump the raw material, so energy input costs are reduced. (4pp)

28.01.81 as 001917 (448RH)

A rotary cutter for size redn. of fibrous inclusions in a liq. to be pumped, esp. liq. manure contg. a notable proportion of straw etc. The cutter has a stationary casing and a coaxial rotor, each fitted with a straight-edged blade inclined in opposite directions to a plane normal to the axis of rotation. As the rotor turns, the cutting edges slide across each other forming a hyperbolic generatrix at the moving interesction. The hyperbola and rotor are coaxial.

The cutting edges are pref. inclined at an angle of about 60 deg.C. To the plane normal to the axis of rotation. Pref. the number of blades on the rotor is different from the number of blades on the casing. Pref. also each moving blade contacts simulatiously at least two fixed blades. Pref. each moving blade is mounted to slide to and fro longitudinal on its support, centrifugal force holding its cutting edge against at least two points of fixed cutting edges.

The straight edged blades are easy and inexpensive to make, fit, sharpen and replace. Cutting edges slide across each other in point contact, requiring less power than line contact shear blades. The sliding contact produces a self-sharpening effect. (8pp)

HEYER/ ★ D15 64533 D/36 ★FR 2474-474
Installation to purify organic waste from mixed settlement using solar energy to support fermentation producing combustible gas

HEYER R 19.11.79-FR-028664

Q42 (31.07.81) C02f-09 C02f-11/04 E03f-03

19.11.79 as 028664 (448KB)

Installation is for the purificn. of all the organic waste material from a mixed settlement, the waste being fermented to produce methane to heat water etc. While the sludge is employed as an agricultural fertiliser. The installation now uses solar energy collectors of the tubular type to provide heat for aerobic fermentation in the waste collection pipeline network. In the treatment station digesters are employed for an anaerobic fermentation to generate methane gas.

The solar energy collectors pref. comprise black-painted steel tubes behind double glazing with a vacuum between the glass panels and a reflective backing behind the tubes. Each waste collection junction is ventilated with solar-heated air to promote aerobic fermentation. Each waste collection junction pref. has a perforated inclined baffle over which solids are merged into which solids are merged into the liq. fraction for gravity flow.

Used in disposal of waste from a settlement including domestic dwellings, factories and agricultural establishments. (22pp)

ROHM D15 91658 A/51 = GB 1596-913
Deionisation of water streams contg. monovalent and divalent cations - involves use of double layered bed of same ion exchange resin which is thermally regenerated and in different states in each bed

ROHM & HAAS CO 31.05.77-US-802142

(03.09.81) *DE2822-280 B01d-15/04 + C02f-01/42

23.05.78 as 021362 (931AT)

An aq. liq. contg. less than 20 mmol. per l. of dissolved salts contg. mono- and divalent cations in a mole ratio 1:3-3:1, is treated to reduce this concn. by passing the liq. into contact with a thermally regenerably ion exchange resin having a greater affinity for divalent than for nonovalent cations.

The resin has 2 distinct zones of functionality, such that the first zone contacted by the liq. comprises the monovalent cationic resin, and the second comprises the hydrogen ion form of the resin followed by countercurrent regeneration of the resin.

The sizes of the 2 zones are appropriate to the amt. of di- and monovalent cations in the fluid to be treated so that the useful cation exchange capacities of the resins in the zones are exhausted at the same time. The vols. of aq. fluid and regenerant passed in successive loading and regeneration steps are regulated to maintain appropriate sizes of the zones. (8pp)

Septic tank vessel divided into three chambers - with floating ball to prevent contaminant overspill to effluent chamber
KLARGESTER ENVIENG 29.04.77-GB-017965
(03.09.81) B01d-21

28.04.78 as ----- (295RP)

A sewage treatment plant comprises a settling tank divided by two frusto-conical partitions into upper, intermediate and lower chambers. Raw sewage is delivered into the lower chamber and effluent flows through the partitions successively to the intermediate and upper chambers. The passage of solids from the lower chamber upwardly is prevented. Liquid effluent is removed from the upper chamber.

The first partition has its larger end uppermost and is located in an upper part of the tank. The second partition is arranged the other way up with its large end below the level of the first partition. The small end of the second partition projects upwardly through the lowermost end of the first partitions, and having a closure at its upper end.

The apparatus is an improvement over the apparatus described in 1,297,959 which when influent flow is above normal occasionally passes solids directly from the lower to the upper chambers. (5pp)

Pumping apparatus for collecting polluted liquids - is effective for removing light oils from the surface of water

EUROTECH INT LTD 19.02.81-GB-005252 (22.02.80-GB-006149)

H03 J01 Q42 Q56 (03.09.81) E02b-15/04 F04c-01/02 F04d-29/04
19.02.81 as 005252 (1345NS)

Apparatus for collecting polluted liquids such as oil on water includes a first pumping stage consisting of a rotatable annular rotor having curved blades shaped to draw liquid inwardly towards the centre of rotation. Stationary blades are positioned within the rotor blades to receive liquid into the spacers between them.

A further pumping stage has rotatable blades shaped to accept the liquid from the stationary blades and deliver it under pressure in an upward direction to an outlet. The pumping apparatus is preferably mounted on a flotation unit which is suitable for collection of oil from the surface of the water. (13pp)

PART- ★ D15 64701 D/36 ★GB 2070-238
Monitoring solids content of conc. liq. sludge - by removing sample and diluting by known ratio before measurement

PARTECH ELTRNS LTD 16.02.81-GB-004815 (23.02.80-GB-006196)

S03 (03.09.81) G01n-15/06
16.02.81 as 004815 (295HM)

Sample is removed from a liq. sewage conduit and fills a metering chamber. When this is full it is discharged into a dilution chamber. The metering chamber is thoroughly washed together with its conduits and the waste enters the dilution chamber until this holds a predetermined depth of liq.. A sensor then measures the solids concn. in the dilution chamber.

Finally the contents of the dilution chamber is returned to the sewage conduit. During operation of the sampling appts., any overflow from the metering chamber is returned directly to the sewage conduit. The apparatus measures the solids concentration of a concentrated liquid sewage. Dilution of the sewage prior to measurement and the use of wash sprays prevents the apparatus including its sensors from becoming blocked by accumulated concentrated sewage. (7pp Dwg.No.1)

NIPC ★ D15 64721 D/36 ★J5 6033-081
Treating effluent from grouting process - involves treatment with slaked lime slurry before adding coagulant and introducing carbon dioxide

NIPPON CHEM IND KK 27.08.79-JP-108195
L02 (03.04.81) C02f-01/52

27.08.79 as 108195 (34DH)

In the treatment of effluent containing Na silicate and earth and soil etc., resulted from grouting process esp. with water glass grout, the improvement comprises (a) adding milky Ca(OH)₂ slurry to the effluent adjusted at a predetermined flow rate as stable as possible in reaction vessel to cause the reaction between the total amt. of silicic ion (sic) and colloidal silica etc. and C at pH of greater than 11.5.

for pref. 30 mins.

The effluent thus treated is transferred to settling vessel (5) at which coagulant, e.g. basic polyaluminium chloride, Al sulphate, polyacrylamide hydrolysate etc. is added to cause flocculation sedimentation and solid liquid separation. CO₂ gas is introduced from liquified CO₂ tank (10) into the separated water to carry out neutralisation whilst if necessary concentrating the separated sludge in sludge concentration vessel (6) followed by dewatering in dewatering apparatus, so that silicic ion concentration of the effluent is below 50 ppm. (5pp)

SUMO ★ D15 64775 D/36 ★ J5 6088-407
High molecular wt. water-soluble polymer prodn. - by polymerisation of (meth)acrylamide, (meth)acrylic acid, and/or (meth)acrylate etc. in presence of ethylene di:amine
SUMITOMO CHEMICAL KK 20.12.79-JP-166704
A14 F09 (17.07.81) C08f-02/44 C08f-20/06
20.12.79 as 166704 (83NS)

Method comprises polymerising (meth)acrylamide, (meth)acrylic acid, (meth)acrylate and/or dialkylaminoalkyl (meth)acrylate salt or quat. salt in aq. soln. at a monomer concn. of at least 30 wt.% in the presence of 0.05 to 0.5 pbw ethylenediamine per 100 pbw of the monomer, at starting temp. of 0 to 30 deg. C and final temp. of at least 70 deg. C. The catalyst is pref. redox system. Since the soln. becomes jelly-like mass as the polymerisation proceeds, the reaction vessel should pref. be designed to allow efficient cooling. After polymerisation, the resulting jelly is pref. cut into pieces and dried by drum dryer, fluidising dryer, etc.

Prod. is used as paper additive, thickening agent, polymeric coagulant in waste water treatment, etc. Ethylene diamine prevents undesirable side reactions at high monomer concn. such as crosslinking, branching, imide formation, etc. (5pp)

Sedimentation tank equipment - for precipitating impurities e.g. sludge from dirty water
EBARA MFG KK 25.12.79-JP-168548
J01 (21.07.81) B01d-21/02 C02f-01/24
25.12.79 as 168548 (26AT)

Equipment for pptg. impurities e.g. sludge from dirty water comprises a sedimentation tank, carrier movable above the tank, sludge scraper for scraping pptd. sludge, etc. Equipment installation space is reduced to improve the working efficiency.

The novelty is that a liq. solid separator is attached to the carrier. A sludge pumping-up structure is located in the sludge pit to pump up to this separator sludge collected into the pit located in the middle bottom of the tank. Screen collecting pumps are disposed at the surface of the water in the tank. (4pp)

TSUH ★ D15 65025 D/36 ★ J5 6089-809
Dewatering unit for endless filter belt - uses an upward slope for initial gravity dewatering before lower belt passes into roller nip
TSUKISHIMA KIKAI KK 22.12.79-JP-166302
J01 P71 (21.07.81) B01d-33/04 B30b-09/24
22.12.79 as 166302 (26BZ)

A device is claimed for dewatering filter cake formed between a pair of an upper and lower endless dewatering belts held with upper and lower rollers to form a gravitational dewatering zone, pressured dewatering zone, and squeezed dewatering zone arranged in this order from the inlet of the device to the outlet. It is used for dewatering sludge after treating waste and dirty water in a filter. The object is to increase the treatment amt. and reduce the final cake water content.

The novelty is that the filter cloth stretched across the lower belt is sloped up from the start end of the gravitational dewatering zone to the last end. The raw water level at inlet is equal to the water level at the start end of the pressured zone. (5pp)

TSUH ★ D15 65026 D/36 ★ J5 6089-810
Appts. for dewatering filter cake - has lower filter cloth held horizontal with rollers in pressurised dewatering zone while upper filter cloth is inclined
TSUKISHIMA KIKAI KK 22.12.79-JP-166303
J01 P71 (21.07.81) B01d-33/04 B30b-09/24
22.12.79 as 166303 (26AS)

Device is claimed for dewatering filter cake formed between a pair of upper and lower dewatering conveyors held with upper and lower rollers to form dewatering zones, including a pressured dewatering zone. Each belt comprises a filter cloth for filtering raw sludge fed to the inlet of the device.

Improvement is that the lower filter cloth is held approx. horizontally with the rollers in the pressured dewatering zone, while the upper filter cloth is gradually lowered (sloped down) away from the start end of this zone so that the angle between both filter cloths, i.e. the belts is gradually or stepwise decreased

in profile.

Filtering rate is increased and cake water content reduced. (4pp)

HITK ★ D15 65027 D/36 ★ J5 6089-811
Belt type dewatering unit - in which filtrate from press zone and shear zone returned to upper belt after washing
HITACHI METAL KK 24.12.79-JP-167874
J01 P71 (21.07.81) B01d-33/04 B30b-09/24
24.12.79 as 167874 (26AS)

Method is claimed for purifying the filtrate drained from a belt type dewatering unit for dewatering filter cake fed from a filter for filtering dirty or waste water. The dewatering unit comprises a pair of dewatering belts turnably held with rollers to form a press zone for pressing the cake between filter cloths stretched across the belts and a shear zone for squeezing the cake by rollers arranged to form a meandering passage of the belts.

Improvement is that the filtrate from the press zone and following shear zone is returned to the upper belt just after it is washed. Concn. of suspended solids in the filtrate is lowered. (3pp)

SHIF ★ D15 65028 D/36 ★ J5 6089-812
Water filtration appts. - comprising rotatable horizontal screen drum with wedge wires attached to outer surface for scooping up suspended solids

SHINMEIWA IND KK 24.12.79-JP-169081
J01 (21.07.81) B01d-33/18
24.12.79 as 169081 (26DJ)

A device is claimed for filtering off suspended solids in dirty or waste water after coarse filtration. It comprises a horizontal screen drum rotatably disposed in a tank having a solids drain port provided with scraper for scraping sludge deposited over the drum and water drain port. The object is to increase the effective filtering area of the drum and the filtering efficiency.

Wedge wires are attached to the outer side surface of the drum to form a corrugated surface so that the suspended solids are effectively scooped up with the edge wires during forcible rotation of the drum. (4pp)

EBAR- ★ D15 65029 D/36 ★ J5 6089-813
Appts. for dewatering sand, sludge cake etc. - includes vibrating structure for belt

EBARA KOKI KK 25.12.79-JP-168553
J01 (21.07.81) B01d-33/32
25.12.79 as 168553 (26AS)

Device is claimed for dewatering sand, sludge cake, or other suspended solids in waste or dirty water, during carrying such solids on a dewatering belt conveyer having a conveyer belt carried on rollers and belt supports.

Improvement is that a vibrating structure is provided for vibrating and impacting the belt. The belt may be made of filter cloth and stretched between driving and drive wheels of the belt. The vibrating structure comprises support rollers in contact with the back side of the belt.

Suspended solids etc. are dewatered without using a vacuum. (4pp)

MISK ★ D15 65030 D/36 ★ J5 6089-814
Rotary drum type filter for liq. filtration - is continuously coated with a powder e.g. diatomaceous earth, which acts as a filter medium

MITSUBISHI KAKOKI KAISHA 22.12.79-JP-166318
J01 (21.07.81) B01d-33/08 B01d-37/02
22.12.79 as 166318 (26NS)

Device (I) is for continuously filtering a liq. e.g. dirty water. (I) comprises a vacuum rotary horizontal drum, half immersed in the liq. contained in a tank. The surface of the drum is precoated with a powder such as diatomaceous earth and then used for filtering the liq. A precoat layer is formed continuously over the surface of the drum. The tank is partitioned into two sections: one for precoating the powder and the other for filtering the liq. (5pp)

SHIM/ ★ D15 65042 D/36 ★ J5 6089-826
Water tank stirrer - with water suction tube supported by vertical rods erected from base with rotary vertical shaft

SHIMURA S 24.12.79-JP-166841
J02 (21.07.81) B01f-07/24 C02f-03/16
24.12.79 as 166841 (26AS)

Device is claimed for stirring water in a water tank or pool, esp. for mixing a very small amt. of agglomerant with the water. Improvement is that a water suction tube is supported by vertical rods erected from a base having a rotary vertical shaft at the center. A motor is connected to the vertical shaft, on which a spiral blade is mounted along the length of shaft, so that rotation of the shaft causes the suction tube having a central opening at the upper end to suck the water through this opening and allows

the water to flow down and away from the shaft.

Water is effectively stirred. (6pp)

An appts. for washing filter elements charged in a tank or sands is provided. The object is to avoid clogging of the elements or sand beds for filtering dirty water.

A jet nozzle for spraying water under pressure into a connecting pipe is connected to it. The pipe communicating with a strainer located in a lower space of the tank through a valve connected to a bottom hole of the tank is connected to a separator for sepg. the water from the filter elements, which are drawn from the tank when the valve is opened. In this washing process, the elements are washed by the water under pressure and returned to the tank through the separator. (J55028784) (3pp)

ASAH D15 04536 B/03 = J8 1034-128
 Poly:aryl ether sulphone semipermeable membrane - cast from polar organic solvent contg. electrolyte

ASAH KASEI KOGYO K 08.07.77-JP-080913

A88 J01 (A26) (08.08.81) *GB2000-720 B01d-13 C08j-05/18

08.07.77 as 080913 (1302AT)

A semi-permeable membrane is formed of a polyaryl ether sulphone having repeating units $\text{Ar}'\text{-O-Ar}_2\text{-SO}_2$ where Ar' and Ar_2 are each phenylene or biphenylene (bonded through different rings) and can be substd. by 1-4C alkyl or alkoxy or Cl or Br. The membrane has a contact angle of its surface to water of at most 65 deg.

Such a membrane is prepd. by shaping into a membrane a casting soln. contg. a polar organic soln. of the polyether sulphone and an aq. soln. of an electrolyte. The membrane is contacted with a liq. miscible with the polar organic solvent, but a non-solvent for the polyether sulphone to coagulate it.

The polyaryl ether sulphones have good resistance to heat and chemicals but are not easily wetted. The use of the electrolyte during casting increases the wettability and hence water permeability of the membrane, which is used in water purificn. (J54016378) (4pp)

J01 (08.08.81) *J56007-607 B01d-13

29.06.79 as 083308 (26DJ)

A device for circulating washing small balls in a tubular membrane separator for separating a liquid such as waste waters in the reverse osmotic, ultrafiltration or precision filtration is new. The object is to catch returned balls from the separator, without reducing the flow rate of the liquid passing through the device. The raw liquid is fed into the separator through the device and drained through it. The balls flow in the same passage as the liquid but caught by the device.

The novelty is in the structure as follows. A rotary core is disposed in a closed casing having inlet and outlet ports connected to the ball and liq common flow passage. The core has recesses for receiving the balls and rotated to return them to the supply port side from the return side and there are clearances between the core and casing to allow the liquid to pass through. (J56007607) (4pp)

NITL D15 35285 D/20 = J8 1034-136
 Cylindrical membrane sepn. module - comprising an outer cylinder with several water permeable nonwoven fabric cylinders bound tightly together

NITTO ELECTRIC IND KK 20.08.79-JP-106171

J01 (08.08.81) *J56031-406 B01d-13

20.08.79 as 106171 (55DJ)

A cylindrical membrane sepn module is claimed, which consists of an outer cylinder and several water permeable nonwoven fabric cylinders bounded tightly together and inserted in the said outer cylinder.

Those cylinders are almost as long as the outer cylinder and a permeable membrane is formed on an inner surface of each nonwoven fabric cylinder. At the both ends of the said cylinder, a casting synthetic resin is introduced and solidified in the outer void between the said nonwoven fabric cylinders and thus practically those nonwoven fabric cylinders have a contact area where they are contacted with the outside cylinder only via the outer surface layer. Even in this contact area, within the layers of the nonwoven fabric of the nonwoven fabric cylinders, a passage where the permeated liq flows is formed along the axis of the cylinder, and the said nonwoven fabric cylinder and the permeable membrane are covered with the said resin at the open end(s) (i.e both ends).

Most useful for ultrafiltration or precise filtration etc for treatment under relatively low pressure (J56031406) (4pp)

OHTA/ D15 34420 B/18 = J8 1034-140
 Membrane sepn. appts. for treating waste liq. - includes perforated stainless steel tubes, fibrous mat, perforated polypropylene film and reinforcing discs

Regenerating waste water, e.g. used water in metal rinsing, is

claimed in which the waste water is introduced in a deionisation chamber of electrodialysis tank and the waste water contacted with an anionic exchange resin.

A Cu wire is crude rinsed and finish rinsed using two electrodialysis tanks and storage tanks contg. different concn. of Cu ion solns. having different pH numbers. A sulphuric acid soln. is used for the crude rinsing step and the finishing rinsing step of the Cu wire. The storage tank contains the finishing rinsing water having 200 ppm of Cu ion concn. and it is used for rinsing the Cu wire to raise Cu ion concn. from 200 ppm to 300 ppm. An anionic exchange resin is fitted in parallel to the electrodialysis tank having a deionisation chamber. The used finishing rinsing soln. is contacted with the anionic exchange resin, is regenerated and discharged into rivers.

Process is effective for removing Cu ion from waste water. (J53019931) (3pp)

 Biological purificn. of waste water contg. nitrogen cpds. - using oxygen acceptor pre-neutralised with calcium carbonate or active slurry

STAMICARBON BV 17.01.80-NL-000300
 (17.08.81) C02f-03/28

17.01.80 as 000300 (510DH)

In the biological purification of waste water contg. N cpds. in oxidised form, where the purification conditions are such that denitrification occurs, using an oxygen acceptor with pH less than 6, the oxygen acceptor is neutralised with CaCO₃ or an active slurry contg. CaCO₃ before it is added to the waste water to be denitrified.

The oxygen acceptor is esp. an aq. soln. of at least one 1-8C carboxylic acid; these acids have the advantage of being biologically degradable. The pH of the oxygen acceptor is esp. less than 4 (less than 3) and neutralisation is pref. to pH 4-6 (4-5). CaCO₃ is esp. used as marl. The active slurry is pref. from a settling or concn. basin in which the purified waste water is sepd. from the slurry.

Acid waste streams can be used as oxygen acceptor, without addn. of extra Ca(OH)₂ to raise the pH. A smaller amt. of active slurry is produced. (10pp)

PETE/ ★ D15 65357 D/36 ★ NL 8000-395
 Swimming pool chlorinator injector - has housing with outlet bore contg. externally operable piston to remove calcium deposit from outlet

PETERS WE U 22.01.80-NL-000395
 A88 Q46 (17.08.81) E04h-03/20

22.01.80 as 000395 (1190DH)

The arrangement is used for adding a chlorine-contg. liquid in the form of a calcium-based bleaching agent to the water in a swimming pool. It comprises a housing(1) having a bore(5) with an inlet(3) connection(4) and an outlet(2) connected (2a) to the pool.

The bore has the same dia. as the outlet end of the housing and contains a piston(6) which can be operated from outside to move axially in the bore to remove the calcium deposit forming therein.

The calcium deposit forming in the outlet bore of the injection housing when using a soln. of a calcium-based chlorine-contg. bleaching agent can be removed without access to the bore, thus preventing exposure to this agent. (6pp Dwg.No.1)

 C07g-07 C08h-01/02

25.01.80 as 000503 (510HM)

Protein material which can be crosslinked to a synthetic, esp. a heat-hardening synthetic material, is a material obtd. by chemical and/or physical modification of a basic plant protein. The basic protein may be obtd. from, e.g. potatoes, wheat, soya or maize, and may be recovered by heat coagulation, pH change, freeze-drying, reversed osmosis, ultra-filtration or addn. of salts, water-sol. organic cpds. or enzymes. The protein is then modified to reduce the mol. wt. esp. to about half, by breakdown with an

acid, an alkali and/or an oxidising agent, e.g. NaOH + hydrogen peroxide. The hydrophobic/hydrophilic balance is then changed by introduction of polar or apolar gps., e.g. acid gps. which can form ionic structures with polyvalent ions.

Prodn. of buttons and of ion-exchangers is claimed. The range of raw materials for prodn. of synthetics is extended. Economical recovery of protein from waste water in the potato starch industry solves environmental contamination problems. (8pp)

12.09.78 as 665390 (132VE)

The filter comprises a vessel (1) split up by vertical walls (3) into filter blocks (4-7) where the first-stage filter chamber (11) is isolated by a horizontal partition (10), with a dirty water feed main, a tubular compressed air feeder (17) and a clean water removal main (18/27)

To optimise operation, each block is fitted with a water distribution channel (19) and a raised vertical partition (8) linking the first- and second-stage chambers, while feeder 17 and channel 19 are in the second-stage chamber (12). Bul.47/23.12.80. (5pp Dwg.No.1)

ENGI = ★ D15 65770 D/36 ★ SU-789-425
Aerator for liquid effluent - has disc with blades and spindle, and springs for protecting torque transmission shaft

ENG EQPT RES PLAN 26.09.78-SU-667544
(23.12.80) B01f-05/16 C02f-03/16
26.09.78 as 667544 (132VE)

The aerator comprises a vertical shaft with a drive, and carrying a disc with blades (5). To increase the drive's service life, each blade has a spindle (6) fixed to the disc, and springs.

The torque transmitted via the shaft to the disc, and the resistance at the blades, rotate these latter on the spindles in lugs (7,8). This tensions the mainsprings (10) of the blades and twists the torsion springs (11). The springs are designed to maintain the blades at 15 deg. to the vertical axis in the direction opposed to the direction of travel. The smooth transmission of the loads due to hydraulic impact of the material being treated, considerably reduces stressing of the drive. Bul.47/23.12.80. (3pp Dwg.No.3)

WATE = ★ D15 65771 D/36 ★ SU-789-426
Biological cleaner for water channels - has oxygenating plants on guided platform for transverse circulation irrespective channel water level

WATER CONSERVATION 15.12.78-SU-698258
(23.12.80) C02f-03/32

The cleaner comprises a charge (7) in the form of oxygenating plants. To maintain a constant set depth of the charge on variation in the water level in the channel, guides (2) on the channel walls carry a reciprocating platform (1), with a floating base (3) and frames (6) for cultivation of the said plants.

The base has a hinge (4) and a flexible link 5 fixed on opposite sides of it, and also a stream guider 8 with a height ratio of 2 relative to the base. The frames 6 on the descending platform, are kept horizontal by the base (3), even when the charge is at its set depth of 0.6-0.8m below the water level. The streamguider, with a rotation range of 25-35 deg. sets up transverse circulation in the water. The cleaner gives effective removal of biological and chemical impurities from natural water, irrespective of the water flow conditions. Bul.47/23.12.80.(3pp Dwg.No.2)

NKWA = ★ D15 65772 D/36 ★ SU-789-438
Liquid effluent sludge dryer - has gravel etc. between double grating of drains, to accelerate storm sludge water removal
NOVOK WATER SUPPLY 11.10.78-SU-676912
(23.12.80) C02f-11

11.10.78 as 676912 (132VE)
The dryer comprises a natural base 1 with drains (2) and sediment outlets (3). To increase the sludge water-filtration and removal rates, the drains are made as sumps whose walls have double gratings and gravel or ground stone between these.

Prof., the drains are located on opposite sides of the dryer. The sediment fed by pipe (10) is moistened by partial breakdown of the suspension and entry into it of the coarsest particles. The base has a 0.002 slope down to the drains, which are 20-40m apart, and the gravel etc. fraction (10-50mm) between the 20- and 400-500mm steps of the 10mm diameter gratings gives a sump height of 1.5-2.0m and a filter wall height of 250-300mm. This design also accelerates sludge-water removal during spring-thaw and stormy periods and reduces capital expenditure by a factor of four. Bul.47/23.12.80. (3pp Dwg.No.1)

Selective removal of ferric ions from aq. solns. - using an acid quaternised crosslinked phenol formaldehyde-sec. amine resin

COMMONWEALTH SCIENT ORG 29.11.79-AU-001490
A97 J01 M25 (A21) (18.08.81) *EP--30-106 C08g-14/06 + C02f-01/42

03.12.79 as 100020 (945WB)

Metal chelating resin selective for ferric ions consists of the acid-quaternised form of crosslinked polymer produced by condensing phenol cpd(s), formaldehyde and di(sec. amino) cpd(s) under neutral conditions.

The resin may be quaternised with strong mineral acid, e.g. H₂SO₄. The amino cpd. is suitably piperazine or 4,4'-bipiperidine.

Ferric ions can be removed from aq. solns. of low pH and subsequently the metal can be easily recovered. Copper or other metal ions are not absorbed. (4pp)

STAB- D15 57267 C/33 = US 4284-514
Chemical pretreatment of hazardous waste in containers - by placing containers in vessel contg. pretreatment medium, and agitating to rupture containers

STABLEX AG 29.12.78-GB-050209
M11 P35 P43 (18.08.81) *EP--13-822 C02f-01/52

20.12.79 as 105712 (1376RH)

Hazardous waste in containers is pre-treated prior to

solidification by agitating the containers in a liquid which neutralises, precipitates or modifies the waste such that the containers are ruptured. The containers are reduced to particles. The waste may contain cyanide and the liquid may be an oxidising agent.

Problem of opening containers is avoided. (4pp)

STAU * D15 65887 D/36 ★US 4284-515
Elemental phosphorus redn. in aq. media - by addn. of alkali(ne earth) metal hydroxide

STAUFFER CHEMICAL CO 10.12.79-US-102167
E36 (18.08.81) C02f-01/54

10.12.79 as 102167 (478HM)

The level of elemental P in an aq. medium is reduced by addn. of a caustic M(OH)_n (I) to the soln. to increase the pH to at least 11. In (I) M is Li, Na, K, Mg, Ca or Ba; n is valency of M. Initial P₄ levels are pref. less than 10 esp. less than 3 ppm. The aq. medium is suitably obtd. from H₂O used in the electric furnace prepn. of P₄. (I) is pref. an alkaline earth hydroxide, esp. Ca(OH)₂. Treated aq. medium may then be clarified with a flocculant, then neutralised.

Simple, inexpensive, practical treatment effectively reduces P₄ levels in aq. media (esp. 'phossy'-water) to very low levels (e.g. less than 5 ppb). (3pp)

GOOD * D15 65888 D/36 ★US 4284-516
Removing low level polychlorinated bi:phenyl contaminants from fluids - using alkali metal aromatic radical anion reagent

GOODYEAR TIRE & RUBBER 04.02.80-US-118294
E14 (18.08.81) C02f-01/70

04.02.80 as 118294 (949HM)

The dehalogenation of low level (ppm) concns. of polychlorinated biphenyls (PCB's) dispersed in a contaminated fluid substrate comprises contacting the substrate with 25-500 moles of a reagent per mole of PCB. The reagent is prepd. by dispersing molten Li, Na or K at not less than 150 deg.C in an inert fluid (esp. the substrate) of b.pt. above the m.pt. of the alkali metal. Amt. of fluid is 250 ml per mole of metal.

This mixt. is then treated with 1.3 moles of aromatic radical anion forming cpd. (I), the process being improved by first cooling the alkali metal/fluid dispersion to room temp. with vigorous stirring under an inert atmosphere. (I) is a biphenyl, naphthalene, anthracene, naphthacene, o-, m- or p-terphenyl or their alkyl subst. deriv. and is dissolved in 500 ml of dimethyl ether, ethylene glycol dimethyl ether or THF.

Process is esp. used for detoxification of PCB's contaminating heat transfer fluids, concn. being reduced from 82 ppm to 2-3 ppm in examples. The process is also applicable to dehalogenation of other organics, e.g. kepone (and its gem diol), aldrin, dieldrin, hexachloro-cyclo-pentadienes, dibromo-chloropropane, tetrachlorodi-benzodioxin, 2,2-dichloro-vinyl-dimethyl phosphate, etc.

Cooling the alkali metal/fluid dispersion with vigorous stirring under an inert atmos. gives high surface area particles with min. oxide coating which are able to give reproducible results on scale up. (4pp)

Prepn. of 7-methoxy-cephalosporin derivs. - by cultivating *Streptomyces* spp. (ATCC 31167) and treating prod. with D-aminoacid oxidase in *Trigonopsis* spp (IF007SS) culture

YAMANOUCHI PHARM KK 22.08.79-JP-107358

B02 (28.03.81) C07d-501/04 C12p-35/08

22.08.79 as 107358 (140BZ)

Prepn. of 7-methoxy cephalosporin derivs. of formula (I) useful as intermediates for antimicrobial cephalosporin derivs. comprises cultivating a microorganism belonging to the genus *Streptomyces* (e.g. *Streptomyces oganensis* Y-G 19Z (ATCC 31167). A new 7-(D-5-amino-5-carboxy valeramido)-7-methoxy-3 subst. cinnamoyloxymethyl)-delta3- cephem-4-carboxylic acid of formula (II) is recovered from the culture. (II) is reacted with a mycelium or a treated mycelium of a D-amino acid oxidase-producing microorganism belonging to the genus *Trigonopsis* (e.g. *Trigonopsis variabilis* (IFO 0755) under an aerobic condition to obtain a new 7-(4-carboxybutyr amido)-7-methoxy-3-(subst. cinnamoyloxymethyl)-delta3- cephem-4 carboxylic acid of formula (III), when R is sulfo. Hydrolysing (III) to convert into new 7-(4-carboxybutyr amido)-7-methoxy-3 (mono- or dihydroxycinnamoyl oxymethyl)-delta3-cephem-4 carboxylic acid of formula (III'), and reacting (III') with a thiol cpd. and, if necessary, esterifying the prod.

In the cultivation addn. of 0.1-5 mg/ml of 4-mono- or 3,4-dihydroxysilycic acid to the medium increases the yield of (II, R SO₃H). In obtaining the D-amino acid oxidase by cultivation, addn. of a D- or DL-amino acid (e.g. D- or DL-methionine) to the medium brings about high enzymatic activity. To attain complete oxidative decarboxylation of (II), pref. a catalase-inhibitor is added (e.g. sodium azide) to the reaction mixt. or used to pre-treat the mycelium or catalase in the mycelium may be deactivated by heat-treatment. In the reaction between (II) and the enzyme system, (III) is obtd. without by prods. by adding a small amt. of hydrogen peroxide to the reaction mixt. (12pp)

Dietetic food contg. edible elastic polysaccharide - obtd. by immersing cellulose-type polysaccharide produced by acetic acid bacteria, in aq. polyhydric alcohol soln.

AJINOMOTO KK 20.12.79-JP-165911

(D16 D17) (18.07.81) A231-01/04

20.12.79 as 165911 (5RP)

The food contains the edible elastic difficult-digestible polysaccharide which is obtd. by immersing the cellulose-type polysaccharide produced by acetic acid bacteria, in the aq. conc. soln. of edible above-2-valent polyhydric alcohol and if necessary, heating the mixt.

As the bacterial strain of *Acetobacter A. acetii* IFO3284, *X. xylinum* IFO3288, etc. can be used. As edible above-2-valent polyhydric alcohol sugar such as glucose, sucrose, maltose, etc., sugar alcohol such as sorbitol, xylitol, maltitol, etc. and divalent

or trivalent alcohol such as propyleneglycol, glycerin, etc. can be used and they are used in the form of the aqueous soln. having the concentration above 20%, pref. above 50%. Though the immersion requires one month at room temp., by heating to 50-130 deg.C. the immersion time can be shortened to 24 hours or less.

Polyhydric alcohol partic. sugar alcohol can be used instead of sugar non-sweet or a little sweet polysaccharide. The prod. is excellent as dietetic food. (3pp)

TOYM ★ D16 64855 D/36 ★ J5 6088-792
Stabilising of acyl-coenzyme/A synthetase - by adding 5'-adenosine triphosphate, 5 adenosine-di:phosphate, 5-guanosine tri:phosphate 5' guanosine di:phosphate and/or their salts

TOYOBO KK 19.12.79-JP-166119

B04 (18.07.81) C12n-09

19.12.79 as 166119 (5RH)

Method comprises combining at least 1 cpd. selected from 5'-adenosine-triphosphate, 5'-adenosine-diphosphate, 5'-guanosine-triphosphate, 5'-guanosine-diphosphate and their salts and if necessary, polyhydric alcohol in a drug containing acylcoenzyme A synthetase (ACS). Recently refined ACS has been used for determn. of free fatty acids in the field of clinical examinations utilising its conjugate reaction with other enzymes. Above nucleotides show much better stabilising effect on ACS than conventional stabilisers and the stabilising effect can be further increased by using the nucleotide together with polyhydric alcohol.

Nucleotide is combined in amts. of 0.001mM-0.1M pref. ca. 1mM in the soln. of ACS and 0.1-1 mg. pref. 10-20 mg. in 100 mg. of powdery ACS. As polyhydric alcohol monosaccharide, oligosaccharide, divalent alcohol, tri- or more-valent alcohol, etc. can be used and they are used 0.5-50 wt.% in ACS drug. (4pp)

MATU ★ D16 64856 D/36 ★ J5 6088-794
Enzyme crosslinking and fixation - by dissolving enzyme and resin in organic solvent coating carrier surface with soln., drying and treating with gaseous fixing agent

MATSUSHITA ELEC IND KK 19.12.79-JP-165867

A96 B04 (18.07.81) C12n-11/06 G01n-27/30

19.12.79 as 165867 (5HM)

Method of crosslinking-fixing enzyme using fixing reagent comprises dissolving enzyme and resin in organic solvent, coating the surface of a carrier with the soln., drying and crosslinking-insolubilising the enzyme by supplying fixing reagent in gaseous phase.

The resin is PVC, PMMA, poly-vinylidene-fluoride, cellulose-acetate cellulose butyrate acetate, cellulose triacetate, etc. The fixing reagent is aldehyde or aldehyde polymer e.g. glutaraldehyde, 2-oxyadipoaldehyde, crotonaldehyde, acrolein, glyoxal, propionaldehyde (polymers). Pref. a high mol cpd. which can react with the fixing reagent by forming a covalent bond is added to the soln. contg. the enzyme and resin to facilitate fixation and decrease the fall of enzyme activity on fixation. Pref. polyethyleneimine, polyornithine, polylysine, polyarginine, etc. is used.

The formed enzyme membrane has excellent adhesion to the carrier. The fixed enzyme has excellent mechanical strength and swelling resistance and can be used repeatedly or continuously for a long time. The fixing reagent is supplied in gaseous phase and the crosslinking-insolubilising reaction is regulated easily by controlling its vapour pressure without changing the enzyme concn. on the carrier. (4pp)

MATU ★ D16 64857 D/36 ★ J5 6088-796
Fixing enzyme to membrane by immersing membrane in enzyme soln. - and crosslinking-insolubilising the enzyme using a vapour fixing agent, e.g. glutaraldehyde

MATSUSHITA ELEC IND KK 18.12.79-JP-165046

A96 B04 (18.07.81) C12n-11/08

18.12.79 as 165046 (5NS)

Method comprises immersing a membrane having fine pores in a soln. contg. enzyme and if necessary other proteins. The membrane is then dried, and the enzyme crosslinked and insolubilised using vapour of fixing reagent. Pref. porous polycarbonate membrane is used as carrier. As fixing reagent glutaraldehyde, 2-oxyadipoaldehyde, crotonaldehyde, acrolein, glyoxal, propionaldehyde and their polymer can be used. Pref. another protein e.g. albumin, polylysine, etc. is combined with enzyme in the soln. to make the fixing reaction easy and prevent fall of enzymic activity at the fixation.

Very thin strong fixed enzyme membrane can be obtd. which can be used repeatedly or continuously for a long time. Large amts. of enzyme can be fixed per unit area of membrane. By using the fixing reagent in vapour phase the crosslinking-insolubilising reaction can be easily controlled through its vapour pressure without changing the enzyme concn. on the membrane.

AJIN ★ D16 64858 D/36 ★ J5 6088-798
Fermentative prepn. of L-serine - by culturing Pseudomonas
variety in culture medium contg. glycine

Normal-paraffins sepn. from mixts. contg. iso paraffins and aromatics - by selective adsorption and two-stage desorption NL280377)

UOP INC 24.09.75-US-616470

E17 H04 J01 (11.08.81) *DE2640-365 C07c-07/13 C07c-09/14

24.09.76 as 114609 (195RH)

The process comprises selective adsorption on a zeolite and subsequent desorption with a desorbing agent, in which two-stage desorption is used. The first desorbing agent (A) displaces the aromatic hydrocarbons from the surface of the zeolite, while the second (B) displaces the n-paraffins from the pores.

Used for treatment of 6-30C hydrocarbon mixts. e.g., a 10-15C kerosene fraction, esp. to obtain pure n-paraffins for biochemical prodn. of proteins for animal or human consumption. Concn. of aromatics in the n-paraffin extract can be reduced to less than 100 ppm., and the need for pre-treatment e.g. by acid washing or hydrogenation to remove aromatics is eliminated. Prepn. of coenzyme A-synthesising protein complex (I) from baker's yeast involves first lysing the yeast cells and then sepg. the solid (free from t-factor) from the liq. fraction. Then treating the solid to solubilise proteinaceous material other than (I), and then contacting the residual solid with the first liq. fraction, contg. t-factor, to solubilise it. The t-factor is the yeast fraction of mol. wt. 400-1000 that solubilises insoluble (I) in presence of C ions.

The (I) is obtd. without the use of volatile and inflammable reagents. It has a reduced content of other proteinaceous materials and is obtd. by a shorter process than previously used, it is storage stable and obtd. in high purity and free from proteolytic enzymes. The (I) can be lyophilised and stored with only minimum loss of activity. It is esp. suitable for use in a test for the early diagnosis of cancer as described in US 4160817. (13pp)

Reversible covalent immobilisation of proteins to inorganic oxide - by silanising then succinylation of the matrix, treating with thionyl chloride then mercapto-acid and reacting with protein amino gp.

N CAROLINA UNIV 20.06.80-US-161645

B04 (18.08.81) C09c-03/08 C12n-09/96

20.06.80 as 161645 (949HM)

The reversible covalent immobilisation of proteins comprises first activating the surface of an inorganic oxide material. This is effected by silanising and succinylating the oxide to give a succinamidopropyl-surface. This is treated with thionyl chloride under anhydrous conditions to give the acyl chloride deriv., which is then reacted with 3-mercaptopropionic acid or mercaptoacetic acid under anhydrous conditions. The obtd. activated surface is then treated with a protein having a reactive amino gp.

The prepn. of a material having an activated surface as above is independently claimed, the activated material finally being dried. Pref. oxide materials are siliceous, esp. porous glass beads or porous silica. Contact with the protein is pref. at pH5-8. The protein may be mobilised by cleavage with hydroxylamine.

The dried, activated material may be stored for extended periods without loss of reactivity with proteins. The remobilisation of the protein is effected under very mild conditions, leaving a portion of the attaching chain bonded to the free protein. This enables the investigation of conformational changes or steric hindrance directly related to the immobilisation procedure. The effect of the microenvironment of the matrix surface can thus be eliminated, so that the effects of partitioning and diffusion can be separated experimentally from intrinsic changes in specific rate constants. Diagnostic agent (I) is an immunoreactive liposome labelled with an antigen or its cognate antibody, sequestering an enzyme having a signal to noise ratio of no less than 5.

(I) is used together with a substrate for the enzyme; a test material and complement. The enzyme activity is detected by a colour change. The liposome may be prepared as described by Szoka and Papahadjopoulos in Proc. Nat. Acad. Sci. 75, 4194-4198/1978. Suitable enzymes include oxidoreductases, hydrolases and lyases. Substrates for detecting the enzyme include p-

nitrophenyl phosphate or 4-methylumbelliferyl phosphate or alkaline phosphatase, 4-aminosalicylic acid or o-dianisidine and hydrogen peroxide for peroxidases and o- or p-nitrophenylglycoside for glycosidase.

Like radio-immunoassay the use of this reagent is rapid, but without the hazards of radioactive substances. It is also more adaptable than the enzyme labelled antigen of prior art. (45pp)

Trisazo dyes of formula (I) are new (M is H or alkali or ammonium cation; K1 and K2 are each residues of couplers of formula (II) and (III). Y is hydroxy or amino; Y2 is hydroxy or amino, opt. substd. by alkyl, acyl or aryl; Y3 is H, lower alkyl or sulphonc acid; Y4 is H, hydroxy or opt. substd. amino; n is 0-2).

(I) are claimed for dyeing leather and paper, and give deep black (greenish to reddish) shades of good fastness. They are readily soluble in water, stable towards acid, have optimum substantivity and good colour yield comparable to that of Acid Black 38 but, unlike this dye, they do not require hazardous intermediates in their synthesis. Appts. comprises a horizontal, cylindrical, perforated drum which is rotated on its axis inside a vessel contg. the liq. The drum is divided into several compartments by radial partitions extending full length of the drum. The vessel has a loading/discharge opening through its circumferential wall. Each drum compartment has an access port with removable door. Each access port can be aligned with the vessel opening by rotation of the drum.

Improvement is that the vessel is pivotable about the longitudinal axis of the drum. When the access port is open and aligned with the vessel opening, the drum and vessel can be temporarily locked together to pivot together about their common axis.

Arrangement facilitates loading and unloading of the machine and minimises handling damage to delicate skins. (33pp)

30.11.79 as 098886 (914HM)

New compsn. comprises (1) a vinyl monomer or unsatd. polyester, (2) a peroxide catalyst and (3) a tert. aromatic amine of formula R₁R₂NQ (I), (II), (III), (IV), (V) or (VI), or the reaction prod. of (II) or (III) with (meth)acrylic acid, (where Q is the gp. (III), Q' is (VIII) in which the phenylene gp. joins to the amino gp. NR₁R₂; Z is the residue of bisphenol A (IX), R₁ and R₂ are -Me, -CH₂CH₂CpH₂p+1 (p is 0-18), -CH₂CH₂OH, -CH(Me)CH₂R₁, -CH₂CH₂(OH)CH₂OC(O)CMe=CH₂ or the gp. (X). R₁ is CqH₂q+1 (q is 0-17); R₁', R₂' and R₃' are H, n-alkyl, -CrH₂r+1 (r is 1-20) or t-Bu, provided that if one of them is t-Bu then the adjacent one is H; R₃ is H, 2-21C n-alkanoyl or CH₂=CR-CO-; R is H or Me; n is 1-10; and m is 2-10).

The tert. amine acts as an accelerator for the peroxide catalysed polymerisation of the vinyl monomer or curing of the unsatd.

polyester. It has high strength and low colour. The compsn. is esp. useful as a restorative dental material, a cold-curing denture base material for fabricating or replacing dentures, or as an orthopaedic bone cement. (13pp)

FARB D21 80936 B/45 = US 4284-621
Cosmetic light-protective compsn. - contains 4-methoxybenzylidene-cyanoacetate as UV A filter and opt. a UV B filter

BAYER AG 18.04.78-DE-816819

E14 (18.08.81) *DE2816-819 A61k-07/42

28.03.79 as 024742 (931PW)

An ultraviolet light protection compsn. comprises an oil or wax carrier contg. a UV-A absorbing amt. of a 4-methoxybenzylidenecyanoacetic acid ester of formula (I), where R is n-hexyl, n-octyl, n-decyl or a prim. (9-10C)-isoalkyl. Pref. (I) is used in a concn. of 0.5-6 wt.%, and the compsn. contains 1 or more cosmetic or dermatological additive.

The ester is esp. the n-hexyl- or the isononyl ester, and the compsn. contains 0.2-10 wt.% UV-B filters, e.g. 2-phenyl-5-methyl-benzoxazole, 2-phenyl-benzimidazole-5-sulphonic acid or 4-methoxy-cinnamic acid isomyl ester. The compsn. is esp. effective at absorbing light of wavelength 320-400 nms. (5pp)

Stabilised water-in-oil emulsions for topical use - contg. magnesium hydroxide or oxide as stabiliser with therapeutic agent

YUR J 29.05.79-US-043266 (16.11.77-US-852147)

B05 E33 (18.08.81) A61k-31/58

29.05.79 as 043266 (+ 22.3.78-US-852147) (1248NS)

Stabilisation of a water-in-oil emulsion is effected by mixing an oil-base dispersion medium, a water-based aq. dispersed phase and up to 2% by wt. of Mg(OH)₂ or MgO.

The emulsions are suitable for topical application to the human body, and they are stable on storage for at least 2 months and are stable when frozen then subsequently thawed to room temp. The emulsions are vehicles for medicinal and therapeutic prods., esp. for use as antiinflammatory and sun-screening prods. when the emulsions are used as vehicles for anti-inflammatory steroids, their stability and efficacy is improved.

Pref. 0.1-0.5% Mg(OH)₂ or MgO is present as stabiliser, and it may be incorporated in the aq. phase before it is dispersed, or mixed directly with the emulsion. (9pp)

Dental composite contg. hydrophobic submicron silica - and glass particles, incorporated into resin, useful as veneer, and for filling cavities

IBSEN R L 08.02.80-US-120119

A96 (20.08.81) A61k-06/08 C08k-03/26 C08k-09/06

02.01.81 as U00031 (251HM) (E) US3770811 US3926906 US4032504 US4150012 US4220582 AU-477135 DE2462271 2.Jnl.Ref N(AU BE JP) E(AT CH DE FR GB LU NL SE)

Filled-resin dental composite (A) contains as filler a mixt. of hydrophobic silica particles (II) of dia. 0.01-0.04 microns and glass particles (III) of dia. 2-30 microns (pref. 7 microns on average). The glass is pref. X-ray opaque, esp. it contains a Ba or Sr salt. (II) is 10-30% and (III) 20-67% on wt. of total composite, and together make up 30-83.5%.

The formulation also contains 16.5-75 wt.% resin plus curing agent and accelerator, or resin plus peroxide curing agent (but no amine), in which case it is useful as a heat-curing veneering dental paste.

The formulations are used to fill carious lesions, and because of their very small particle size give a smoother finish than standard fillers while retaining comparable chemical and mechanical properties. Their consistency makes them suitable for application with an amalgam carrier. (19pp)

are of formula (I): (where R1 is H, CN or ethynyl and X1 is F, or
R1 is 1-propynyl and X1 is H or F).

(I) are pesticides useful particularly as insecticides and
acaricides. They are especially useful against insects which are
injurious to plants, against flies such as *Musca domestica*, midge
larvae, and keratin-eating insects, (e.g. keratin-eating
Lepidoptera larvae). (I) are accordingly suitable for use in plant
protection and for protecting wool-contg. textiles against insect
attack. (15pp)

RETI- D22 21414 D/12 = EP --34-174
Hydrogel implant of crosslinked acrylate copolymer - of 2-
hydroxy-ethyl and alkyl acrylate ester(s), esp. for use as scleral
buckles

RETINA FOUNDATION 20.08.79-US-067630
A96 (A14) (26.08.81) *WP8100-570 C08f-18
19.08.80 as 901753 Based on WP8100570 (1251PW) (E) US3503942
US3983083 US4228269 E(CH DE FR GB LI)
A shaping-retaining hydrogel implant, which is relatively soft
and pliable, comprises a crosslinked copolymer of 2-
hydroxyethyl acrylate and an alkyl acrylate (pref. 1-5C esters,
esp. methyl or n-butyl). The implant pref. has hardness (Shore
Durometer Type A-2) 50-40 when dry, but less when wetted with
water or an aq. soln. The implants pref. contain an aq. liq., esp.
one contg. an antibiotic.

They are made by filling a mould with a soln. of the monomers
water-soluble organic solvent, crosslinking agent and free
radical initiator, then polymerising, crosslinking and curing. The
implant is then removed from the mould, and residues and
solvent extracted.

The implants are esp. useful as scleral buckles for use in retinal
detachment surgery but can also be used e.g. as contact lenses.
The hydrogels have better softness, elasticity and resistance to
tensile rupture than known materials. Their pore size (20-30
angstroms) is too small to trap bacteria or other pathogens but
large enough to absorb hydrophilic antibiotics or other aq. drugs.
The implants are well tolerated and stable to both heat
sterilisation and biodegradation. (23pp)

Hygienic dirt tray for excrement of domestic cats - lined with
disposable plastic sheet prefolded to fit tray and form bag when
removed

ALBERT J P 22.01.80-FR-001272
A92 P14 (24.07.81) A01k-01/03
22.01.80 as 001272 (448HM)

Hygienic dirt tray for the reception of excrement etc. of domestic
cats is in the form of an open-topped rectangular receptacle, pref.
of polystyrene, with shallow walls which are upright or slope
slightly outwards.

Outside one end of the tray a bar is fitted to two arms which are
pivoted on opposite side walls of the tray. The inside of the tray is
lined with a disposable, plastic sheet formed with definitive, fold
lines. These folds ensure that the sheet conforms to base and
sides of the tray. The pivot bar tensions and locks the sheet in
position.

The sheet can be lifted out as a pocket contg. the litter and
excrement without the lifter's fingers becoming contaminated.

 21.12.79 as 167085 (51DJ)
The method comprises dropping a divided type absorbing fibre from a loading appts. with a scraping roll to obtain scraped fibre, and spraying a water absorbing type resin from a spray nozzle to the scraped fibre to produce a water absorbing type material consisting of a uniform mixt. of the fibre and the resin.
 The fibre is pulp, cotton, wool, viscose rayon, nylon, polyester, or polypropylene. The resin is obtd. by polymerising a water-soluble monomer, polysaccharide, and a crosslinking agent. (9pp)

TAKE ★ D22 65090 D/36 ★ J5 6090-002
Industrial fungicide compsn. - comprising mixt. of di:alkyl ester of halo:formic acid and 4,5-di:chloro-1,2-di:thiol-3-one

TAKEDA CHEMICAL IND KK 24.12.79-JP-168973

C03 F06 G02 (F09) (21.07.81) A01n-37/06 A01n-43/26

24.12.79 as 168973 (108DJ)

Industrial fungicide compsn. contains as active component a mixt. of di-lower alkyl ester of halofumaric acid (A) and 4,5-dichloro-1,2-dithiol-3-one (B).

The ratio of blend of (B) to (A) is 0.05-2 (0.1-0.5) pts. wt. of (B) to 1 pt. wt. of (A). The compsn. is generally used in the form of organic solvent soln., emulsion, wettable powder, aq. soln., suspension, granule, fine granule or paste. The compsn. is applied to the object by coating, spraying, immersing, mixing, or kneading. When applying to the paint, the compsn. is added in such a manner that the final concn. of the active component may be 20-500 ppm. It is possible to use the compsn. in combination with other fungicide, insecticide, aroma, etc. The mixt. shows synergic effect. It is effective in the prevention of putrefying of industrial prods. and industrial materials (e.g. textile emulsion, latex emulsion, emulsion paint, emulsion wax, spindle oil, industrial cooling water, water used in the mfr. of pulp and paper) and in the prevention of generation of fungi in said industrial materials. The active mixt. has no residual toxicity or pollutes the environment. It can be prepd. at low cost. (4pp)

EART- ★ D22 65092 D/36 ★ J5 6090-004
Insecticide for clothes - contains 1-ethynyl-2-methyl-2-pentenyl alcohol ester of e.g. tetra:methyl cyclopropane-1-carboxylic acid

EARTHSEIYAKU KK 21.12.79-JP-167053

C03 E15 (21.07.81) A01n-53

21.12.79 as 167053 (108AS)

Insecticide for clothes contains as active component at least one 1-ethynyl-2-methyl-2-pentenylalcohol ester of 2,2,3,3-tetramethyl cyclopropanecarboxylic acid, 2,2-dimethyl-3-(2',2'-dichlorovinyl) cyclopropane-1-carboxylic acid and/or 2,2-dimethyl-3-(2'-methyl-1'-propenyl) cyclopropanecarboxylic acid.

The ester has high vapour pressure and exerts an excellent gas effect at normal temp. It has an immediate effect, has very low toxicity, is odourless and has a long-lasting effect. The effective concn. is 1/1000-1/200 times, as compared to paradichlorobenzene, naphthalene and camphor. (7pp)

26.12.79 as 168090 (172RP)

The laminate consists of three layers of dry process nonwoven fabrics with layer (2) sandwiched between layers (1) and (3). Layers (1) and (3) comprise nonwoven fabric consisting of heat-cementing conjugate fibre of 3-50 mm length. Layer (2) comprises nonwoven fabric in which the following components are uniformly distributed: (a) heat-cementing conjugate fibre of 3-10 mm length 5-30%; (b) natural fibre 40-70%; (c) pulp 5-30%; (d) high water absorbing polymer 5-40% (wof).

The laminate is heat treated at a temp. higher than m.pt. of low melting component of the conjugate fibre and m.pt. of synthetic pulp made from thermoplastic resin and lower than m.pt. of high melting component of the conjugate fibre. The laminate has good heat sealing property and prevents (2) from swelling out.

The laminate shows excellent water absorption and retention and is useful for diaper, sanitary napkin, etc. (4pp)

P73 (18.08.81) B32b-31/10
12.05.80 as 147996 (1320DJ)

Elastic strips are stretched and attached to diaper sections cut from a continuous absorbant web. The strips are stretched in a direction transverse to the direction of movement of the diaper sections. The strips are then allowed to contract and pleat the diaper.

Elastic strips are intermittently stretched by grippers mounted on chain conveyor over the diaper sections, cut and attached to glue lines on the sections. Clamps are used to hold the cut strips as they are attached to the diaper sections.

The process differentiates from the prior art of US4081301 wherein the strips are stretched in the direction of movement of the diapers. (13pp)

J01 (10.06.81) C11b-03/12
29.01.80 as 218698 (39HM)

Method for the purificn. of vapours in the waste gas vacuum lines between thermal treatment appts. and subsequent vacuum sets, for pressure ranges of up to 13.3 Pa, esp. for fatty acid distn. plant, uses recirculated fatty acids for the absorption. These fatty acids are admixed to the waste gases with their fatty acid content in the vapours in a closed circuit. The admixture of the fatty acids in a quantitative ratio to the waste gases of at least 20:1.

This reduces the losses of fatty acid to zero. The new method requires less appts. and saves the maintenance required for the using operation. (9pp)

Articles to be sterilised are placed in an enclosed chamber which is then evacuated via a filter. Steam is admitted to a jacket to raise the temp. of the chamber to sterilising temps. Pref. a portion of the steam from the jacket is released into the chamber via a check valve.

The chamber does not have a drain line and condensate from the sterilisation process is collected between low dams at the bottom of the chamber. On completion of the sterilisation, the chamber can be evacuated to cause the condensate to evaporate.

Method is used to sterilise highly infectious material. The elimination of the drain connection from the chamber prevents the escape of partially sterilised infectious condensate which might create a hazard. (5pp)

Extn. of vegetable oils from seeds - using low frequency mechanical vibrations in two stages with different orientation

FATS RES INST 10.01.79-SU-711945

(07.11.80) C11b-01/10

10.01.79 as 711945 (70VE)

Vegetable oils extn. from sunflower, cotton, soya etc. seeds, is carried out in the field of low-frequency mechanical vibrations having amplitude of 5-10 mm, oriented perpendicularly to the surface of the material subjected to extrn. the liquid phase miscella is then sepd.

This method is improved by preliminarily applying extrn. with conc. liquid phase (15-30%) under the action of mechanical vibrations oriented parallel to the surface of the material subjected to extrn. The frequency of these vibrations is 900-1500 cycles per min. and their amplitude is 2-5 mm. This stage lasts 15-20 min. The main extraction is carried out with a liquid phase having concn. up to 15%. The vibration frequency is 200-400 cycles per min. the amplitude is 5-10 mm.; the duration is 29-30 min.

By this method, the percentage of fine particles passing into the liquid phase is decreased and, hence, the purity of the liquid phase is improved. Bul. 41/7.11.80. (3pp)

Conc. textile softening compsn. contg. cationic softener - nonionic surfactant and solvent plus electrolyte as viscosity regulator
LESIEUR COTELLE SA 23.04.81-BE-888535
A97 E19 (17.08.81) C11d

23.04.81 as 888535 (597DJ)

The compsn. comprises an aq. dispersion contg. 10-30% of one or more cationic textile softening agents, 0.2-3% of one or more nonionic surfactants and 3-7% of viscosity regulations obtained by the joint action of solvents and electrolytes. Other ingredients are colourants, optical whiteness, perfumes and preservatives.

Pref. softening agents are alkyl imidazolinium salts and quat. ammonium salts esp. distearyl dimethyl ammonium chloride, or an N-methyl NN-di (beta 14-18C) alkyl ethyl N-betahydroxyethyl ammonium methyl or ethyl sulphate. Pref. nonionic surfactants are alkoxyated fatty alcohols or alkylphenols. The ratio of softener/nonionic agent is from 10:1 to 50:1, esp. from 15:1 to 40:1. Solvents are pref. alcohols esp. ethylene and/or propylene and/or hexylene glycols.

The viscosity regulator enables a low viscosity concentrate with viscosity stable to prolonged storage, easy to distribute in an automatic doser, having a prolonged stability to temp. variations and dispersing easily and very finely in a softening rinse bath. (14pp)

UNIL ★ D25 49738D/28★CA1100-262
Fabric softeners based on quat. ammonium cpds. - contg. choline fatty acid ester salt.

UNILEVER LTD. 16.11.77-GB-047791

A97 E16 (05.05.81) D06m-13/34

15.11.78 as 316294 (13pp367DJ)

Fabric softening compsns. contain 1-80 wt.% of a quat. ammonium cpd. (I) and 0.5-25 wt.% of a choline ester salt (II) of formula $(Me_3NCH_2CH_2OCOR)(+)$ $X(-)$ (where R is 6-24C alkyl and X is an anion).

The compsn. can also contain 0.5-10 wt.% of a soil-release agent, esp. a copolymer of polyethylene terephthalate and polyoxyethylene glycol (e.g. 'Permalose T' or 'Zelcon TGF'. RTM's). Suitable cpds. (II) are described in FR1129648. Suitable cpds. (I) are of formula $(NR_1R_2R_3R_4)(+)$ $X(-)$ (where R_1 and R_2 are 8-22C alkyl, R_3 and R_4 are 1-3C alkyl and X is an anion).

The compsns. can be used on both cotton and synthetic fabrics. Inclusion of (II) improves both fabric-softening and antistatic activity and inhibits decline in antistatic properties during storage of the treated fabrics.

 Automatic dishwashing compsn. contains (a) 20-60% of a detergency builder (I); (b) 10-30% alkali metal silicate solids (II) (to give 5-15% SiO₂); (c) an active Cl₂ cpd. (III) (to give 0.5-3% available Cl₂); (d) 1-9.5% low foaming surfactant (IV); and (e) 1-30% of a stabilised H₂O-soluble polymer -(CH(CO₂M)O)_n (V). (Where M is alkali metal, NH₄ (and tetra(1-4C) alkyl), or 1-4C alkanolamine; n averages at least 4; and no. of polyacetal carboxylate segments are at least 50% by wt. of total polymer).
 (I) is an alkali metal tripolyphosphate, pyrophosphate, orthophosphate, or carbonate or mixts. (III) is e.g. dichloroisocyanuric acid (or Na or K salt), 1,3-di-Cl-5,5-di-Me hydantoin, N,N'-di-Cl-benzoylene urea etc. or mixts. (IV) is: the condensn. prod. of an opt. branched opt. unsatd. 10-20C alcohol or acid With 4-50 mol. ethylene oxide (EO) (the prod. opt. capped With propylene or butylene oxide and/or short chain alcohols and/or short chain acids); polyethylene of mol. wt. 1400-30,000; the condensn. prod. of (8-18C) alkyl-phenol with 4-50 mol. (EO); HO(C₂H₄O)_x(C₃H₆O)_y(C₂H₄O)_xH (y is at least 15; (C₂H₄O)_x + x is 20-90% of total cpd. wt.; mol.wt. 2000-10,000); or mixts. Compsn. has pH 9-10.9 at 2500 ppm and is free of materials having pH 12 or more at 1% in H₂O and other organic chelating builders.

Although compsns. contain reduced amts. of P and highly alkaline materials they have improved cleaning and esp. hard-H₂O filming performance. (7pp)

PROC D25 34773 D/20 = US 4284-532
 Isotropic liquid laundry detergent compsns. - contg. ethoxylated nonionic and amine oxide surfactants builders and hydrophilic surface active cpds.
PROCTER & GAMBLE CO 11.10.79-US-083907
A97 E17 (E14) (18.08.81) *EP-28-038 C11d-01/34 C11d-17/08
 11.10.79 as 083907 (937PW)

Stable liq. detergent comprises (a) 11.5% ethoxylated alcohol nonionic surfactant of formula R(C₂H₄O)_nOH, where R is aliphatic 12-13C hydrocarbyl radical, ave. n is 6.5 and has HLB value of 10-13, (b) 6.7% amine oxide surfactant of formula (I), where R1 is 12-16C alkyl and R2 and R3 are methyl, (C) (i) 5% water-soluble salt of citric acid, (ii) 7% water soluble salt of pyrophosphoric acid, (d) 12% hydrophilic material chosen from (ethoxylated) monoalkyl esters of phosphoric acid, having HLB value above 14, and (e) 46% water.

The compsn. has good cool water detergency for cleaning fabrics. (6pp)

R1R2R3N → 0 (I)

KAOS D25 42661 B/23 = US 4284-533
Low viscosity aq. stable liq. cleansing compsn. - contains partly crosslinked polyacrylic acid, hydrotropic agent, nonionic surfactant, scouring agent and pH regulator

KAOSOAP KK 28.11.77-JP-143042

A97 E17 (A14 A25 E14) (18.08.81) *DE2850-256 C11d-01/72 C11d-03/14

17.03.80 as 130765 (+ 2.11.78-US-957164) (937PW)

Liq. abrasive cleaner compsn. consists of (a) 0.1-0.6 wt.% crosslinked polyacrylic acid of 1000-100000 ave. degree of polymerisation and Brookfield yield value at least 100 g/sec.cm which is prepd. by copolymerising (meth)acrylic acid with triallyl isocyanurate (b) 1-10 wt.% hydrotrope of ROH or R'O(RO)nH, where R is 1-3C alkyl; R' is H, 1-4C alkyl, phenyl or benzyl; R is ethylene or propylene, n is H ave addn. mole number with provisos that n is 1-20 when R' is H and n is 1-3 when R' is other than H; (c) 0.5-10 wt.% nonionic synthetic organic surfactant having HLB of 10-17 pref. a condensate of ethylene

oxide and prim. or sec. 10-20C alcohol, (d) 7-20 wt.% water insoluble abrasive pref. silica, alumina, magnesia, titania, aluminosilicate, silicon carbide, iron oxide, powdery silica or powdery sands which have particle size of 2-150 microns.

The balance is water and water soluble pH regulator pref. NH₄OH, KOH, NaOH or alkanolamine maintaining compsn. at pH 8-8. Compsn. is stable and does not undergo sepn. after long storage time and can be dispensed easily because of its low viscosity. (5pp)

Arrangement of Abstracts

'MAJOR' COUNTRIES – An alerting abstract of every basic document is provided, and of examined equivalents from West Germany, Great Britain, Japan, the Netherlands and the United States, and granted and unexamined European and unexamined PCT equivalents. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

DERWENT PATENTS SERVICES

1981 INSTRUCTION CLASSES REGISTRATION FORM

A round of Derwent instruction classes, to be held during September, October and November 1981, will be of very special significance to both new *and* existing users.

The Syllabus of classes is as follows:

Elementary A Coding (IC2)	<i>A two day course for new users of CPI Section A codes, covering basic principles and discussion of examples. Max. 20 participants.</i>
Elementary BCE Coding (IC3)	<i>A two day course for new users of CPI Sections BC & E codes with special reference to the New Chemical Code, again with discussion of examples. Max. 20 participants.</i>
Advanced A Coding (IC4)	<i>A two day course for those with previous training and experience of the CPI Section A codes. Max. 20 participants.</i>
Advanced BCE Coding (IC5)	<i>A two day course for those with previous training and experience of CPI Sections BC & E codes, with special reference to the New Chemical Code and coverage of complex examples. Max. 20 participants.</i>
Online User Instruction and General Overview (IC6)	<i>A one day course giving in-depth treatment of all access points except special coding, together with formulation of strategy and "hands-on" experience. A general overview of Derwent and its Patents products will also be given. Max. 20 participants.</i>
Advanced Online Searching (IC7)	<i>A one day course demonstrating the use of special coding concepts and other parameters in the formulation of search logic to retrieve specific subjects or chemical structures. Max. 10 participants.</i>

Cost per person for these classes is: IC2 through IC5 £60 or \$130; IC6 and IC7 £40 or \$90.

PANE/ ★ D11 66091 D/37 ★ BE -888-593
Filling pre-baked patisserie prod. for cutting individual portions - to reference lines ensuring fair share of filling to each portion

PANELLA C 28.04.80-IT-048524

(17.08.81) A21d

28.04.81 as 888593 (448HM)

Filled patisserie prod. and a method of filling a prebaked prod. with an edible, creamy or semi-liq. paste. The filling is injected via an in-line series of hollow needles as the needles are withdrawn after being inserted into the prod. The surface traces left by the extracted needles are used as reference lines between which cuts are made to divide the prod. into parallel slices or angular segments. In this manner, each slice or segment is then known to contain its share of filling.

The surface traces are pref. covered with an edible decoration, e.g. icing, chocolate, coffee cream. Cutting lines can be marked to ensure that the filling lies centrally between the surface traces or decorations.

Prodn. of confectionery prods. ready for cutting into filled, individual slices or segments. Each individual portion is easily cut to contain a predetermined quantity of filling. (10pp)

GOTH- ★ D11 66264 D/37 ★ DE 3042-266
Thin filled wafer mfr. - by automated loading of waters and filler for heating and cooling tunnel

ING & MECH GOTH 28.12.79-DD-218205

(03.09.81) A21b-07 A21c-15/02

08.11.80 as 042266 (39AT)

A machine for the prodn. of two-part pastry, consisting of two thin wafers with a filling layer between them, consists of a first endless chain on which a first wafer is sprinkled with the filler and covered by a second wafer. A doubling chain above the first then keeps the pastry together as it is passed through a heating tunnel, and a cooling tunnel to the discharge station.

The entire operation, including the laying of both wafers on the chain, is done automatically. No damage is done throughout the treatment to the delicate thin wafers. (25pp)

DIER D11 74667 B/41 = DS 1757-361
Dough kneading appts. comprising rotating tub - contg. two rotating kneading tools arranged to give minimum heat generation and vibration-free operation

DIERKS & SOHNE 30.04.68-DE-757361

(03.09.81) *NL-161-339 A21c-01/02

30.04.68 as 757361 (39AT)

A dough kneading machine consists of a revolving cylinder with flat bottom and two eccentric contra-rotating kneading tools. The tools consist of U-shaped tubes which are twisted along their length through 180 deg. in the direction of their rotation. The crossbar of one U-bracket is offset by 90 deg. from that of the other U-bracket.

The radius of action of the bracket nearer to the trough middle overlaps the centre line of the trough.

Such a machine has a much increased kneading capacity, combined with a min. of heat generation, resulting in a better quality of the dough. DS (6pp)

BONG/ ★ D11 66422 D/37 ★ FR 2474-822
Heater for forced circulation of air through bakery oven - has interchangeable module comprising heater and heat exchanger

BONGARD P 05.02.80-FR-002742

(07.08.81) A21b-01

05.02.80 as 002742 (448BZ)

The air heater comprises a blower unit employing one or more fans. The suction side of the blower unit is connected to the upper part of the oven. The blower unit recycles the air into the top of a duct extending down through an indirect heat exchanger, which has a low level outlet leading into the lower part of the oven.

An interchangeable heater fits removably into a chamber inside the heat exchanger casing. The heater is designed to be withdrawn via a removable side panel of the casing. The panel is bolted or clamped over the heater access port which is surrounded by a compression seal to be sandwiched between panel and casing.

Inside the casing, opposed side walls at right angles to panel are pref. fitted horizontal support slides. The leading end of the heater than has a transverse bar of which the ends rest on the slides. The indirect heat exchanger may be of the multi-plate

type. The heater may employ a gas/oil burner or may use electric resistance heating elements.

The heater is easily removable to facilitate cleaning and maintenance of the heater itself, the heat exchanger and the interior of the casing. It is now simple and inexpensive to convert from gas or oil firing to electric heating and vice versa. (6pp)

META- ★ D11 66423 D/37 ★ FR 2474-823
Mfg. waffles etc. in split moulds holding prods. vertically - to eliminate skill required for manual turning of horizontal moulds

MFR METAL TOURNUS 31.01.80-FR-002507

(07.08.81) A21b-05/02

31.01.80 as 002507 (448BZ)

A process and a mould assembly for making waffles etc. The mould is of the type which demoulds the prod. by splitting centrally into two half-moulds. The two half-moulds are brought together with their contact faces in a vertical plane. Semi-liq. waffle paste is introduced into the mould cavity via an inlet between the contact faces. The vertical mould is heated to cook the prod. and the mould-halves are subsequently parted to demould the solidified cooked prod.

The mould inlet is pref. at the top of the mould assembly and paste is fed in by gravity. As the paste is introduced, clearance between contact faces should be less than 1.5mm. The paste is pref. poured while its viscosity is between 25 seconds and 2 minutes CF4. Cooking temp. is pref. between 140 and 180 deg.C.

Mould-halves can be hinged or slidable, or both, for relative movement which parts and brings them together. The width of the interface contact surface is pref. not less than 5 mm, more partic. between 8 and 25 mm.

Used for moulding and baking waffles, fritters, wafer biscuits, pancakes etc. (11pp)

BUIT- ★ D11 66426 D/37 ★ FR 2474-831
Fast cooking cereal based prod. e.g. macaroni - produced by steam gelatinising thin walled paste and drying

BUITONI 05.02.80-FR-002461

(07.08.81) A231-01/16

05.02.80 as 002461 (597HM)

Process comprises prepn. of a paste with water and semolina or flour. The paste is formed into thin walled elements e.g. by extrusion or lamination. The starch is then gelatinised by steam cooking the elements under pressure followed by drying the pastes to below about 13% moisture content.

The process is applied to prods. such as macaroni, which are rehydrated with boiling water. It enables rapid cooking in a few minutes without adverse effect on the taste. (10pp)

BRAR- ★ D11 66499 D/37 ★ GB 2070-408
Flaky pastry dough prodn. - by slicing mass of dough contg. discrete hard fat lumps, and pressing or rolling flakes formed

BRIT ARKADY CO LTD 26.01.81-GB-002326 (26.01.80-GB-002701)

(09.09.81) A21d-13/08

26.01.81 as 102326 (955KB)

In the prod. of flaky pastry, the requisite quantities of flour cpd. fat or cake margarine, water and salt are mixed, then discrete pieces of high m.pt. hard fat are added, and the mixt. agitated to give a dough contg. the hard fat still in separate pieces. After cooling if necessary, the dough is cut, flaked or sliced into thin strips which are collected so as to lie wholly or partially on top of one another. The flakes are then rolled, or pressed and then rolled, into a sheet of dough consisting of thin layers of dough separated by layers of hard fat.

The process is quick, as the need for resting the dough is avoided. The machinery required is simple. (4pp)

GEME- D11 05989 C/04 = US 4285-653
Folding food-crepe along diagonal by dropping into shaped casing - feeding fold between pinch rollers removing crepe from casing

ETABGEN MEC OUEST (EGMO) 04.07.78-FR-019944

+ Q36 (25.08.81) *GB2025-306 + A21c-11

26.06.79 as 052328 (1376JB)

Crepes are folded by allowing them to fall from the end drum of an upper conveyor belt onto a hollow casing which is positioned to form a fold transverse to the movement direction. The crepes are then passed between a pair of horizontal feed rollers adjacent to

the casing, onto a lower conveyor belt. The base of the casing is below the upper surface of the lower belt and has a wall which directs the crepes towards the pair of rollers.

Hardening of starch during cooling after cooking is prevented. (7pp)

QUIN/ ★ D11 67871 D/37 ★ US 4285-978
Decorating baked goods with sharp coloured patterns - using printed transfer carrying water-sol. edible inks

QUINLIVAN S L 21.08.80-US-180003 (08.05.78-US-904030)
(25.08.81) A23g-03/28

21.08.80 as 180003 (21.3.79-US-022627) (955BZ)

Decorated baked goods are prepd. by forming a body of relatively plastic uncooked unleavened dough, having a flat upper surface, applying a transfer having a pre-printed design in an edible water-soluble ink on it, and supplying moisture to the transfer to cause the ink to leach out onto the dough surface. The dough is then baked.

The method enables complex designs in several colours to be applied by unskilled persons. It is suitable for domestic or large scale use. The ink pattern is sharp, strongly coloured, and well fixed on the dough surface, so it does not run on application of a glaze. The finished goods may be frozen. (7pp)

IZZI/ ★ D11 67872 D/37 ★ US 4285-979
Bread dough product e.g. pizza - formed from flat sheet partially fried and subsequently baked

IZZI E F 03.06.80-US-155972 (30.05.78-US-910892)
(25.08.81) A21d-06

03.06.80 as 155972 (295BZ)

A bread dough is formed into a flat sheet which is fried to a partially cooked condition. The frying time is sufficient to seal the surfaces of the sheet, but insufficient to permit distortion of the surfaces or to permit the dough sheet to separate internally into layers separated by air.

The dough is baked subsequent to the frying to obtain a cooked dough sheet with a crisp outer shell and a moist bread interior with the same shape as the originally formed dough sheet.

The product can be topped to form a pizza which can be frozen if desired. Also the product can be split and a sandwich filling inserted between the layers. Alternatively it can be cut into sticks prior to the frying stage and flavoured e.g. to form garlic bread sticks. (14pp)

D12: MEAT; FISH PROCESSING

MARU- ★ D12 66107 D/37 ★ CA 1103-984
Prodn. of palatable, flavour-rich squid prods. - including washing, seasoning and press-heating prior to skin removal

MARUTO TOYOYAMA SHO 31.07.78-JP-093481
(30.06.81) A231-01/32

23.11.78 as 316728 (558RH)

Semi-processed squid prods. are prepd. by washing raw squid, previously dressed by removing legs and intestinal parts and opening the body to spread out, in water while stirring to remove any sticky dirt; softening the skin, partic. the collagen layer, while hot, followed by cooling to ambient temp; mixing with seasoning agents and allowing to stand in a container for about 2hrs; and drying at least 35 deg.C for about 4 hrs. to water content 35-50 wt. %.

The prods. may be allowed to stand in a covered container at 20-25 deg.C for at least 24 hrs. without further drying, spread between upper and lower heat plates at 150-200 deg.C and pressed at 30 kg/cm.2 for about 3mins to water content 27-35. %. The press-heated prod. can be placed on a grinding roller to destroy the tissue fibres and peel off the skin, torn into long strips using a machine and seasoned.

The press-heated prod. is rich in flavour and durable in storage over a long period without using preservatives or vacuum packing; and gives highly palatable torn-up prods. The semi-processed prod. has palatable softness and shows high penetrability of seasoning agents. The process gives a higher yield and lower environmental pollution and has lower costs than the conventional method. (1pp)

LUKE/ ★ D12 D/37 ★ CS 7906-503
Collagen casings for meat products
LUKE S E 26.09.79-CS-006503
(30.06.81) A22c-13

MOHN/ ★ D12 66148 D/37 ★ DD -148-922
Fish gutting machine - with movable guide clamps and tiltable rotary tool

MOHNKE H 05.02.80-DD-218884
(17.06.81) A22c-25/14

05.02.80 as 218884 (39HM)

Gutting machine for headed fish, esp. for use on board of fishing trawlers, consists of one or several pairs of curved guide clamps which are joined by a hinge at one end and can open out against the force of a spring. Various sizes of clamps are available and they can be moved relative to rotary scraping and cleaning tools in the horizontal and/or vertical direction.

This machine is readily adaptable to different types and sizes of fish and reduces manual labour in the rotary tool area to a min. (8pp)

NMHB D12 44299 D/25 = DS 2949-631
Double fish fillet skinning machine - with pre-scalping device of circular cutters and shaped blades

NORDISCH MASCH R BAADER 10.12.79-DE-949631
(03.09.81) *DE2949-631 A22c-25/17

10.12.79 as 949631 (39PW)

A machine for skinning double fish fillets, specially herrings in a marinated or seasoned condition passes the fish first by an endless belt to a pair of vertical cutter blades in the centre along the direction of motion which reach with their cutting edges to just above the belt. A circular cutter performs a centre cut and an endless chain with pricks carries the fish along the vertical blades.

These continue into a pair of L-shaped scraper blades which extend the cut more outward until the fish is passed on to the skinning blade above a roll at the end of the belt.

This ensures that the skin, e.g. of fat herrings, is reliably removed from the area of the dorsal fin rays. DS (5pp)

ADCO/ D12 21390 D/12 = EP -34-631
Manual fish scaler - liquid jet lifting scales before removal by toothed scraper

ADCOCK M R 28.08.79-US-070419
(02.09.81) *WP8100-506 A22c-25/02

28.08.80 as 901759 Based on WP8001112 (1358RP) (E) No-Citns. E(AT CH DE FR GB LI LU NL SE)

Fish scaler has a nozzle connected to a scraper and delivering an angled jet which lifts the scales from the skin immediately before they are detached by the scraper.

The row of teeth is pref. curved and the guard has part which is spaced from and perpendicular to the scraper front surface. The jet is pref. delivered from holes in a tube located adjacent the teeth and connected to a valved delivery tube secured to the scraper handle. Each hole pref. makes an angle of 45 deg. with a tangent to the surface of the adjacent tooth.

The scraper pref. has at least one row of serrated teeth projecting from its front surface, and a guard to deflect liquid and scales. (29pp)

OTIE/ ★ D12 66368 D/37 ★ EP -34-872
Dehydrating pre-coagulated protein-contg. sludge - by tangentially injecting low pressure steam to precipitate agglomerates

OTTENSE P K 25.02.80-NL-001128
C03 (02.09.81) A23k-01 C02f-11/18 C12m-01/02

24.02.81 as 200219 (295HM) (E) US3936375 GB1192848 GB-420720 GB-196239 CH-227358 CH-491824 E(AT BE CH DE FR GB IT LI LU NL SE)

Pre-coagulated, protein contg., aq. sludge, which may or may not contain fat, obtd. from a water purificn. plant, is dehydrated. gas heated above 80 deg.C is passed into the sludge to agglomerate it. In a pref. embodiment, the gas is steam above 100 deg.C and at a pressure of 1.03-1.10 kg/cm2. Pref. during the introduction of the gas, the sludge is subjected to shear forces obtd. by injecting the gas tangentially so that it will rotate the sludge mass.

The sludge to be treated is pref. preheated to below 80 deg.C. The agglomerated sludge is filtered off and the filtrate obtd. used for the preheating. When fats are present, the agglomerated sludge is cooled to below the solidifying point of the fat, prior to filtration. The initial material may be sepd. into a protein-contg. sludge and a fat-contg. sludge which are processed separately. The sludge treated may be obtd. from a slaughter-house and is treated in an economical manner, to produce a protein-contg. agglomerate useful as a fodder. (16pp)

BORD/ ★ D12 66424 D/37 ★ FR 2474-825
Butchers powered hand knife for boning meat - gives blade an angular pivotal oscillation as it is reciprocated longitudinally
BORDETR 06.02.80-FR-002560
(07.08.81) A22c-17
06.02.80 as 002560 (448BZ)

A butcher's powered hand tool for boning meat has a knife blade that reciprocates longitudinally by a mechanism in a hand-held housing. Simultaneously with the longitudinal reciprocation, the mechanism is now designed to impart to the blade an angular, pivotal oscillation about the longitudinal axis of the blade.

Pref. the blade mounting is reciprocated by a crankpin rotated by bevel gears which are driven by a flexible cable transmission from a remote motor. The mounting is fixed to a slider which is reciprocated in a sheave block fixed in the housing. A longitudinal cam track on the slider engages a transverse peg in the sheave block; as the slider is reciprocated across the peg, the cam produces the pivotal, oscillatory motion.

The blade is pref. adjustable in its mounting to present its cutting edge at different angular settings.

The pivotal oscillation is necessary to part meat from bone. This has previously required a fatiguing, manual dexterity on the part of the butcher. (9pp)

UNIL D12 63784 A/36 = GB 1597-373
Uniform meat prod. prepn. from meat pieces - comprises pickling, cooling, coating with heat stable glue compsn., compacting and heating
UNILEVER NV 23.02.77-GB-007613
(09.09.81) *DE2807-563 A231-01/31
01.03.78 as ----- (931AT)

A unitary meat prod. is produced by assembling pieces of meat in a process comprising treating the pieces with a curing compsn. contg. phosphate ions to impregnate the meat; cooking to set the meat protein; and coating the cooked pieces with an edible, thermostable, heat-settable glue compsn.

The coated pieces of meat are then compacted, and heated to set the glue. Pref. beef is used as the meat, and the curing compsn. comprises an alkali metal tripolyphosphate, pyrophosphate and/or hexametaphosphate.

The prod. remains coherent on reheating (e.g. in the form of slices in gravy), retains the original texture of the meat, and does not wrinkle on reheating. (5pp)

UENS ★ D12 66818 D/37 ★ J5 6092-733
Meat preservative and preparing meat prod - where preservative comprises sorbic acid, capric acid mono:glyceride and nitric acid sp.

UENO SEIYAKU OYO KE 25.12.79-JP-167516
E17 (E36) (27.07.81) A23b-04/12
25.12.79 as 167516 (5AT)

Method is characterised by treating meat with preservative composed of (a) 0.05-0.2 (pref. 0.1-0.15) w/w% (as sorbic acid) of sorbic acid or its salt, (b) 0.005-0.05 (pref. 0.01- 0.03) w/w% capric acid monoglyceride and (c) 13-30 (pref. 20-27) ppm nitric acid gp.

Nitrite has been combined in meat prod. with the object of (a) suppressing the growth of the germs causing food poisoning esp. botulism, (b) colour-developing meat material in pink colour, (c) intensifying the taste and flavour specific to salted meat material, etc. For suppressing the growth of germs 120-156 ppm of nitrite has been required and for colour- developing 13-30 ppm of nitrite is required. It has now been found that by using the

preservative composed of (a), (b), (c) and (d) the growth of the germs can be suppressed sufficiently with decreasing the amt. of nitrite to the min. level required for colour development. (10pp)

Squid processing to remove tentacles and eyes - and viscera from body and body skin

UNIV OF CALIFORNIA 10.08.79-US-065538
(25.08.81) A22c-25/14
10.08.79 as 065538 (295BZ)

Squids are fed body-first, to an alignment section where a finger engages the end of the envelope of the body to advance it to a reference position. Knives then remove the tentacles and eye section which fall through separate chutes. Preferably the knives also remove a small portion of the envelope to facilitate the subsequent skinning process.

The body falls through an orienting chute and becomes impaled on a rotating hollow peg. Water jets remove the exterior skin and viscera. Preferably the rotating body is briefly clamped on the rotating peg to improve the removal of the skin and viscera.

The apparatus recovers and cleans the body of a squid. (6pp)

Moulded poultry product shaped as cooked bird - with white meat in breast regions and dark meat in legs

LEWIS R 30.05.80-US-155148 (13.03.78-US-885516)
Q34 (25.08.81) A231-01/31 B65d-81/34
30.05.80 as 155148 (+ 25.4.79-US-033132) (295BZ)

A cooked poultry product is prepared by providing a flexible bag whose closed end is placed inside a mould whose cavity has the configuration of a whole cooked bird. This consists of breast and leg portions. The mould is placed on end and a filling tube is inserted through an access hole in the mould into the open end of the bag.

A white meat is forced through the filling tube causing the bag to stretch and the meat to fill the breast portion of the mould. A dark meat is subsequently introduced to fill the leg portions. The open end of the bag is closed and the mould is heated to cook the meat.

The resulting product is shaped like a cooked bird with white meat in the breast region, and dark meat in the leg regions. (7pp)

Cereal grain purification - by washing with calcium hydroxide soln. before mechanical working and pref. neutralising with carbon di:oxide
BATSCHIEDER A 29.12.79-DE-952708
P41 (03.09.81) B02b-01/04
29.12.79 as 952708 (200RH)

Cereal grains are purified by washing for at least 8 min. with Ca(OH)₂ soln. before the mechanical separation of both fruit husk surface layers.

After cleansing, the grains can be ground or worked to other prods., e.g. breakfast flakes. Ca(OH)₂-treatment kills parasite eggs and microorganisms on grain surface, in grain groove and in longitudinal cell membrane layer. The tomentum is removed

completely. At least 50% of noxious chemicals can be removed.

The grains can be washed with Ca(OH)₂ after opening their cleft. The soln. can be prepd. by using 1.2 g quicklime/l water. Washing is pref. continued up to a grain wt. increase of 4%, by moisture absorption. The fruit husk becomes elastic and is more easily separated. The Ca(OH)₂ used in washing is converted to CaCO₃ by neutralising with CO₂. Part of the CaCO₃ pptes. in the longitudinal cell membrane layer, where it promotes the loosening of fruit husk residues. (13pp)

SCHA/ ★ D13 66248 D/37 ★ DE 3007-383
Concentrate based on yeast liq., useful in human or animal nutrition - prepd. by partial evapn., adding milk or starch prods. etc., then drying
SCHANZER 27.02.80-DE-007383
C03 (D16) (03.09.81) A23k-01 A23l-01
27.02.80 as 007383 (1251AT)

Prod. of a concentrate (A) comprises first evaporating yeast liq., opt. after adding a soln. or suspension of by-prods. (B) from the dairy, starch or food industries or from industrial fermentation processes, to give a pre-concentrate (C) of 16-50% dry matter content. This mixed with suitable raw materials to increase dry matter content to 35-60%, then the blend dried to over 80% dry matter.

The final prod. contains, per 100 pts.dry matter, (a) 20-60pts. yeast liq. solids; (b) 30-60% milk by-prods. solids; (c) 5-25 pts. starch prod. solids; (d) 0-15 pts. cellulose and/or prods. rich in crude fibre; (e) 0-25 pts. fermentation process solids, and (f) 0-20 pts. solids from alcoholic fermentation, pulps or hydrolysates. (A) themselves are also claimed.

(A) are useful for human and particularly animal nutrition. It can be made with a standardised compsn.; has satisfactory stability, does not have any unpleasant taste; and is made simply and economically (esp. reduced energy costs for evaporation) from waste materials. (A) are rich in proteins. B vitamins, minerals, trace nutrients, enzymes and 'unidentified growth factors. (30pp)

Multiple effect evapn. for conc. liq. plus air heating - supplies condensate to heat exchangers in series to preheat liq. and air

LAGUILHARRE SA 04.02.80-LU-082130

(07.08.81) A23c-01/12 B01d-01/26

19.11.80 as 024565 (448BZ)

A process and an installation for the evaporative concn. of a cold liq., e.g. a milk prod., and the simultaneous preheating of a fluid in circulation, e.g. air for a hot air dryer. The installation comprises a multiple effect evaporator in which vapour produced in one effect is used to produce evaporative heat in the next effect. Vapour/condensate from at least one effect is used to preheat the circulating fluid.

All or part of the condensate remaining after vapour/condensate has been employed to warm the circulating fluid is now used to preheat the cold liq. to be evaporated. This condensate is desirably premixed with all or part of the condensate draining from the various effects and all or part of condensate from the final effect. The condensate from at least one effect is passed through a first heat exchanger to heat the circulated fluid esp. air. Then through a second, indirect heat exchanger in which liq. to be evaporated, esp. skimmed milk, is preheated. Condensate is pref. drained from the final effect, optionally via a buffer tank, into the line connecting the first, indirect heat exchanger to the second.

Used partic. for concn. of skimmed milk by evapn., hot air being produced simultaneously for spray-drying the conc. skimmed milk. (14pp)

A97 (09.09.81) A23g-03/30

21.07.80 as 023769 (955BZ)

In the prepn. of chewing gum, all the usual gum base materials including natural resin, vinyl acetate resin, polyisobutylene, ester gum, emulsifier, filler, etc. and the usual additives, e.g. sucrose, glucose, starch hydrolysate, artificial sweetener, flavour, colourant, etc. are kneaded together under pressure in a single step.

The press is pref. 4-10, esp. 6-8 kg per sq. cm. The mixing time is typically 0-15 mins. and the temp. reached is 50-60 deg.C. Mixing may be carried out in conventional appts. e.g. Banbury mixer, pressure type kneader, etc. Pref. addn. of volatile flavours is delayed until only about 1 minute of mixing time remains.

The mixing process is complete in a short time, and requires only simple appts. The temp. remains low, so degradation of gum ingredients is avoided. (10pp)

Shelling nuts esp. cashew nuts by cutting longitudinal grooves - on aligned nuts then splitting by wedges

WIDMER & ERNST AG 27.02.80-CH-001557

(09.09.81) A23n-05

08.07.80 as 022286 (295BZ)

Nuts are oriented by passing along a vibrating chute and are then gripped between a pair conveyor belts. The belts carry the nuts to a grooving station where a pair of milling discs cut grooves of defined depth equal to or less than the shell thickness. At a downstream station wedges enter these grooves and split the shell to release the kernel.

Pref. the milling discs each have an associated knurled disc of

slightly smaller radius which bears against the surface of the shell to limit the depth of the groove. The milling discs are mounted on pivoting arms which move to conform to the profile of the nut.

The apparatus shells cashew nuts, macadamia nuts or coconuts. (17pp)

AMCY ★ D13 86504 D/37 ★ GB 2070-430
Bait for ants contg. pyrimidinyl-hydrazone insecticide - dissolved in fatty acid and edible oil

AMERICAN CYANAMID CO 28.02.80-US-125592

C02 (09.09.81) A01n-25/02

27.02.81 as 106298 (1251KB)

A compsn. comprises a soln. of the insecticide (I) in (a) at least one fatty acid (II) and (b), at least one edible oil (III). (II) is oleic, linoleic, linolenic and/or stearic acids, and (III) is soyabean oil (crude or once- or twice-refined), cottonseed, corn, coconut, olive, palm, tall and/or peanut oils. Pref. solns. contain 1-10 wt.% (I); 11-20 wt.% (II) and 70-98 wt.% (III). They are made by dissolving (I) in (II) at 30-80 deg.C then adding (III) or by dissolving (I) in a pre-formed mixt. of (II) and (III) at 30-80 deg.C.

The solns. are useful for controlling ants (both agricultural and domestic pests), e.g. the fire ants *Solenopsis invicta* and *S. richteri*. (I) are readily soluble in (II), and when combined with (III) the soln. is attractive to the ants. (6pp)

VICS ★ D13 86506 D/37 ★ GB 2070-449
Milk homogenisation by passing between ball and seat - with adjustable restrainer limiting homogenisation aperture

VICKERS LTD 23.02.81-GB-005666 (28.02.80-GB-006749)

(09.09.81) B01f-05/08

23.02.81 as 005666 (295KB)

Milk is pumped through the axial bore of a tube whose downstream end defines an annular seat. A ball is positioned close to this seat and is restrained by a plunger which can be moved to adjust the spacing between the ball and seat. Milk passes through the space and becomes homogenised. It is discharged via a transverse bore. The plunger is non-compressible but is contacted by a resilient member against which an adjustment screw bears.

The appts. homogenises milk prior to analysis e.g. for fat content. (6pp)

SOLL ★ D13 86521 D/37 ★ GB 2070-501
Making uniformly sized confections, e.g. chocolates - by spreading molten blob into contact with annular mould

SOLLICH GMBH R CO 29.02.80-GB-006958

A88 (09.09.81) B29c-03

29.02.80 as 006958 (295HM)

Uniformly sized confections are formed by depositing blobs of a flowable confectionary substance onto a surface. Each blob is surrounded by an annular mould spaced from the blob. Pressure is exerted on the blob to cause it to spread out into contact with the mould. The blob is permitted to set and is sepd. from the mould. Pref. the mould has a non-stick coating such as PTFE to facilitate the sepn. Pref. the blob is cooled by the forced flow of a coolant through passages in both the surface and the mould.

The method is used to produce confectionary items on which are deposited an additive such as nuts, raisins, toasted flakes or crokank pieces. Pref. the additives are deposited on top of the blob prior to spreading. (6pp)

TOAG ★ D13 86605 D/37 ★ J5 6061-982
Compsn. for maintaining freshness of food - comprising oxygen absorbing agent, hygroscopic or deliquescent cpd. acidic in aq. soln., and (bi) carbonate

TOA GOSSEI CHEM IND LTD 22.10.79-JP-135120

E37 (E13 E14) (27.05.81) A231-03/34

22.10.79 as 135120 (42AS)

Compsn. (I) composed of oxygen-absorbing agent (II), hygroscopic or deliquescent cpd. (III) which is acidic in aq. soln. and carbonate (IV) or bicarbonate (V) is new.

(I) can prevent both decomposition and decolorisation of food, because (I) absorbs oxygen and generates carbon dioxide which prevents the breeding of various germs and keeps the freshness of food.

Examples of (II) are reduced iron powder, ferrous sulphate, ferrous oxide, iron carbide, ascorbic acid, catechol, pyrogallol, etc. As (III), anhydrous phosphoric acid, sulphur trioxide, halides of iron, cobalt, nickel, zinc, aluminium, etc. cobalt acetate, etc. are used. (IV) and (V) are lithium carbonate, sodium carbonate, magnesium carbonate, sodium bicarbonate, lithium bicarbonate, etc. Molar ratios of (III) to (IV) or (V), and of (IV) or (V) to (I) are 0.03-2, and 0.01-6, respectively. Such values are preferred.

diatomite, activated clay, etc. in amts. of 0.001-10 pts.wt. per 1 pt.wt. of the mixt. of (II), (III) and (IV) or (V) is pref. added. (6pp)

NISO ★ D13 66819 D/37 ★ J5 6092-740
 Sugarless candy mfr. - from mixt. of maltose, cyclodextrin, oligo:saccharide and minor amt. of glucose
NIPPON SHOKUHIN KAK KK(SHIN-) 26.12.79-JP-168239
(27.07.81) A23g-03
 26.12.79 as 168239 (5DJ)

The method is characterised by using the mixt. composed of 40-75% (50-70)% of maltose, 0.5-10 (0.5-3)% of cyclodextrin, 20-50 (25-40)% of oligosaccharide and below 5% of glucose, as the starting material.

Maltose gives mild taste and flavour and improves the transparency and non-hygroscopicity of obtained candy. Cyclodextrin improves the non-hygroscopic property of candy synergically with other components. Oligosaccharide gives proper viscosity to the solution, improves the moulding property and the form-holding property of the candy and prevents the crystallisation of maltose. It is desirable to use the mixt. free of glucose, but the formation of some glucose in preparing the sugar soln. is inevitable. Thus it is necessary to suppress the formation of glucose as little as possible and at most below 5%.

The sugarless candy which is low sweet, low hygroscopic and excellent in transparency and has mild taste and flavour, can be obtd. (7pp)

RIKV ★ D13 66820 D/37 ★ J5 6092-746
 Mulberry leaf powder for artificial feed for silkworms - obtd. by treating raw leaves with plant sterin and (poly)phenolic acid and/or (poly)phenol:aldehyde
RIKEN VITAMIN CO LTD 27.12.79-JP-170779
C03 (27.07.81) A23k-01/18
 27.12.79 as 170779 (5HM)

Mulberry leaf powder is obtd. by treating raw mulberry leaf with (a) plant sterin and if necessary (b) at least 1 of (poly)phenolic acid and (poly)phenolaldehyde.

The plant sterin is beta-sitosterol, stigmasterol, campesterol, brassicasterol, etc. and is used in amt. 0.5-5% based on raw mulberry leaf. The cpd. (b) is protocatechuic acid, gallic acid, p-hydroxy-benzolc acid, protocatechuic aldehyde, gallic aldehyde, -phydroloxybenzaldehyde, vanillin, etc. and it is used in amt. 0.2-2.5% based on raw mulberry leaf.

Recently artificial feed has been used for silkworm culture and all artificial feeds contain mulberry leaf powder which is obtd. by crying raw mulberry leaf and pulverising it. Though the results with artificial feed is equal to that with raw mulberry leaf in infant period, it is inferior in adult period. This is because effective components in mulberry leaf are vaporised and/or decomposed during drying and pulverising. By adding plant sterin to raw mulberry leaf prior to drying the loss of effective components during drying and pulverising is prevented and by adding cpd. (b) the improving effect is further increased. The artificial feed contg. thus obtd. mulberry leaf powder has equal effect to raw mulberry leaf even in adult period. The mulberry leaf powder content in artificial feed can be decreased. (4pp)

28.04.80 as 144681 (1251RH)
Peanuts etc. are analysed for presence of aflatoxins (I) by first mixing a paste of the ground nuts with methanol and water to form a slurry. The filtrate from this slurry is mixed with dichloromethane, the organic phase evaporated and the residue reacted with trifluoroacetic acid (TFA) to form derivatives of (I). The TFA is then evaporated, the residue mixed with THF-acetic acid soln. to form a mobile phase and this filtered through a mini-column, then injected into a high-pressure liq. chromatograph to separate individual (I), the concns. of which are measured.

Pref. 80:20 methanol-water is used in the first stage, and the filtered slurry can be combined with a salt (esp. Zn acetate) soln. The pref. mobile phase is 20% THF plus 80% of 1% acetic acid (by vol.).

The method is rapid (existing procedures take about 2.5 hr.) and can detect a total (I) level of 1ppb (3-5ppb in the known procedure). (6pp)

Fructose polymer extraction from dahlia tubers - by grinding and sepg. liq. phase
MITCHELL W A 10.03.80-US-128978
(25.08.81) C131-03

10.03.80 as 128978 (367AT)
Extraction of fructose polymers (mainly inulin and inulides) from dahlia tubers is effected by grinding the scrubbed tubers at 2-40 deg.C to a particle size of ca. 10 mesh, and sepg. the water solubles from the insoluble fibrous material within 10 min or less, pref. by centrifuging or pressing.

A fructose polymer concentrate with a solids content of 40-70% can be obtd. from the extract by boiling for 3-10 min, sepg. coagulated proteins by decanting or centrifuging, and conc. the clarified extract by evapn. at atmospheric or reduced pressure. A dry crystalline prod. can be obtd. by cooling the concentrate to 1-15 deg.C, seeding with inulin crystals, allowing the mixt. to crystalline for ca. 12 hr, removing mother liquors by centrifuging, and drying the prod. at 35-70 deg.C. (4pp)

(25.08.81) A231-01/22
28.02.80 as 125425 (955AT)

A homogeneous liq. condiment compsn. for colouring or flavouring foods or beverages contains (1) lecithin (2) tartaric acid esters of mono- and diglycerides, and (3) one or more edible flavourings or colourings. The wt. ratio of (1) plus (2) to (3) is at least 1:4.

The wt. ratio of (1) plus (2) to (3) is pref. between 1:3 and 10:1 esp. 1:1. The wt. ratio of (2) to (1) is 3:7 to 3:1, esp. 1:1. Component (3) is typically a spice or herb, an oleoresin e.g. of black pepper, an essential oil, or an colouring e.g. bixin, lycopene, capsanthin, beta-carotene etc. or any combination of these.

The compsn. is dispersible in both oil and water phases of a food. It can provide all the seasoning and colouring additives required in a food in a single compsn. It is stable indefinitely to oxidn. and sepn. of components. It has no functional effect on foods except the dispersion of the condiments and colours. (9pp)

COKE ★ D13 67875 D/37 ★ US 4285-982
Photostable anthocyanin pigment compsns. - contg. flavanoid cpds. as stabilisers
COCA-COLA CO 10.03.80-US-128463 (30.08.79-US-070971)
E24 (25.08.81) A231-01/27
10.03.80 as 128463 (367AT)

Photostable colourant compsns. comprise an anthocyanic pigment (I), i.e. an anthocyanin or anthocyanidin, in combination with a photoprotective agent (II) comprising a sulphonated polyhydroxyflavonol, a poly(hydroxyalkyl)flavonol, a sulphonated polyhydroxyflavone, a sulphonated polyhydroxyisoflavone or a sulphonated aurone. The (II): (I) molar ratio is at least 1:1 (esp. 5:1).

(I) is pref. cyanidin rutinoside (Ia), grape-skin colourant or apigeninidin chloride. (II) is pref. hydroxyethylrutin (IIa), apigenin sulphonate, biochanin A sulphonate, quercetin -5'-sulphonate, quercetin disulphonate, morin disulphonate or 4'-methoxyaurone mono- or disulphonate. The compsns. can also contain an acidulant, esp. citric or phosphoric acid.

The compsns. can be used to colour foodstuffs, esp. beverages or beverage syrups, concentrate or dry mixes. (8pp)

NORD- ★ D13 67876 D/37 ★ US 4285-983
Fixation of volatile flavouring agents - by encapsulation with starch hydrolysate
NORDA INC 02.05.79-US-035349
(25.08.81) A231-01/22
02.05.79 as 035349 (367BZ)

Volatile flavouring agents (acetaldehyde and/or essential oils) are fixed in a carrier matrix (starch hydrolysate with a DE of 28 or less) in the form of free-flowing dry particles by (a) forming the flavouring agent into an aq. soln. (for acetaldehyde) or o/w emulsion (for essential oils) to obtain an aq. liq. with a viscosity of 200 cP; (b) spraying the aq. liq. onto a bed of free-flowing carrier particles so that part of the carrier dissolves in the liq. droplets to form a satd. soln.; (c) allowing part of the water in the droplets to evaporate so that the carrier forms a continuous film on the droplets; (d) allowing the film to solidify; (e) separating the solidified particles from the carrier particles before the former have had time to agglomerate; and (f) drying the solidified particles to remove the rest of the water.

The process avoids use of elevated temps., thus avoiding flavour degradation. The product particles are oval to spheroidal beadlets with a high content of stably fixed flavouring agent (e.g. 4-10 wt.%). (10pp)

A filtration device for pressurised liquids consists of a vertical cylinder in which a stack of spaced filter discs is mounted. The liquid inflow is through a pipe near the centre with tangential holes between each filter disc to impart a spiral motion. The outflow is through a similar pipe near the periphery.

Each filter disc consists of a central plate of metal or plastic, with a greating of grooves leading to the central tube for the filtrate discharge. This plate is covered on both sides by porous polyethylene, coated with a microporous (1-100 nm) membrane. Such a filter has an excellent efficiency and a simple design for low-cost manufacture. (7pp)

PERC- D15 49247 B/27 = EP G002-727
Continuous effluent filtration - by passing effluent alternately cross/wise to flow of descending filter material

PERC SRL (UTUM) 22.12.77-DE-757209

Liquids, specially effluents, are continuously filtered in a vertical cylinder in which a bed of filter material in the shape of an annular cylinder is kept in steady descending motion. The spend material is constantly extracted at the bottom and recharged after reconditioning at the top.

The liquid to be filtered is directed radially inward in the lower half, and radially outward in the upper half. This is an uncomplicated filter system which has an enhanced filtering efficiency and increased throughput. (9pp)

STAB- D15 57267 C/33 = EP G013-822
Chemical pretreatment of hazardous waste in containers - by placing containers in vessel contg. pretreatment medium, and agitating to rupture containers

STABLEX AG 29.12.78-GB-050209
 M11 P35 P43 (02.09.81) *EP--13-822 A62d-03 B09b-03 C02f-11
 19.12.79 as 302964 (977NS) (E) No-Citns. E(AT BE CH DE FR IT LU NL SE)

Hazardous wastes received in containers at a waste disposal plant are pretreated by placing the unopened containers in a vessel contg. a pretreatment medium and submitting the containers to an agitating process which ruptures the containers and deposits the contents in the vessel. Pref. the agitating process is carried out by members depending from arms rotatably driven by an upstanding shaft in the central part of the receptacle.

There are three types of chemical pretreatment:- (1) neutralisation (2) pptn. of the soluble hazardous component in insol. form, and (3) other specific chemical process, e.g. oxidn. of cyanides to cyanates. (5pp)

Ultrafiltration membrane mfr. - by pouring soln. of di:chloro di:phenyl sulphone bisphenol copolymer in hydrophilic polar solvent onto plate and immersing in methanol
TOYO SODA MFG KK 26.12.79-JP-168139
A88 J01 (A26 A32) (25.07.81) B01d-31
26.12.79 as 168139 (96RH)

Mfr. of ultrafiltration membrane comprises dissolving dichlorodiphenylsulphone-bisphenol copolymer into hydrophilic polar solvent, pouring the resulting soln. onto a glass plate or a porous plate, and then immersing the casting into methanol or its mixt. within 50 sec. after pouring, without evaporating the solvent.

Used for concn. and rejection of high polymer, and also sepn. of a mixt. of different mol. wt. polymers.

In an example, 25g polysulphone resin was dissolved in N,N-dimethylformamide. The resulting soln. was poured in 0.3mm thickness over a polyethylene nonwoven fabric, and the casting, while still on the nonwoven fabric, was immersed into water maintained at 2 deg. C within 30 sec. to form membrane. Then, the casting was washed with stream of water for 12 h to completely remove solvent. The resulting membrane exhibits water transmissivity rate of 90L/sq.m.h at 0.5 kgG/sq.cm. Rejection to 0.3wt. % aq. bovine serum albumin soln. was more than 99% under 0.5kg/sq.cm. (3pp)

TOYJ ★ D15 66646 D/37 ★ J5 6091-815
Ultrafiltration membrane mfr. - by dissolving di:chloro-di:phenyl sulphone bisphenol condensed copolymer in mixed solvent, immersing in water and then methanol
TOYO SODA MFG KK 26.12.79-JP-168140
A88 J01 (A26 A32) (25.07.81) B01d-31
26.12.79 as 168140 (96PW)

Method comprises (a) dissolving dichlorodiphenylsulphone-bisphenol condensed copolymer into a mixed solvent consisting of solvent which is good solvent for the copolymer and miscible with water and solvent which is poor solvent or nonsolvent for the polymer and immiscible with water, (b) pouring the resulting soln., (c) immersing into water and (d) immersing into methanol. The process makes it possible to prepare membrane having uniform quality, since process does not include heat-drying for removing solvent. The membrane is used for concentration and

rejection of high polymer and colloid suspending in water.

In an example, with 90 ml DMF there was mixed 10 ml of xylene, and 20 g of polysulphone resin was dissolved into the mixed soln. The soln. was poured over polyethylene nonwoven fabric so as to be about 200 micron thickness, immediately after, the casting was immersed into methyl alcohol maintained at 10 deg.C, and stood for 24 hr, and again immersed into water. The resulting membrane exhibited water transmissivity rate of 180 L/m².hr under 0.5 kgG/cm². The rejection of 0.2 wt.% aq. egg albumin soln. was 95%. (3pp)

SASA-★ D15 66659 D/37 ★ J5 6091-888
Additive to produce drinking water - comprises sodium or calcium hypochlorite and at least one salt of potassium, sodium, calcium or magnesium

(25.07.81) C02f-01/72 C02f-09

27.12.79 as 173687 (51WB)

Method comprises (a) adding sulphuric acid to waste oil to dissolve Fe powder in the waste oil as an iron salt, (b) introducing the resulting waste oil into a sepg. tank to separate floating oil and by-produced waste water contg. the iron salt, (c) adding a slurry of calcium carbonate to the waste water to adjust PH to 5.8-6.0, (d) introducing air into the resulting water to convert the iron salt to ferric hydroxide, (e) introducing the water contg. ferric hydroxide into a thickener to separate the ferric hydroxide from the water, (f) introducing the resulting sepd. water into an apparatus having rotary plates with deposited bacteria to biologically treat it, and (g) removing organic impurities from the water to obtain purified water.

Organic impurities are effectively removed from the water. (5pp)

EBAI ★ D15 66661 D/37 ★ J5 6091-900
Processing high water content sludge - using reagent obtd. by polymerising starch or cellulose

EBARA INFILCO KK 25.12.79-JP-168723
A97 (25.07.81) C02f-11/14

25.12.79 as 168723 (51DH)

The method comprises adding a polymer type cpd. with good water absorbing properties to waste sludge containing a large amount of water to obtain dehydrated and dried sludge particles. The cpd. is obtained by polymerising starch or cellulose with acrylic acid or acrylonitrile or cross-linking a salt of acrylic acid.

In further detail waste water was treated with the activated sludge treating process to by-produce a waste sludge containing 84.5% water. The waste sludge was centrifugally dehydrated in the presence of an organic polymer agent to obtain a filter cake.

Starch was polymerised with acrylic acid to obtain a polymer cpd. high in water absorbing properties, 2% of the cpd. was added to the filter cake, and stirred therewith in air to convert the cake to porous dehydrated sludge particle. (3pp)

FUJT ★ D15 66716 D/37 ★ J5 6092-145
Aq. slurry solidifying agent - comprises cement and mixt. of calcium sulpho aluminate and calcium sulphate

FUJISASH IND KK 25.12.79-JP-167694
L02 P43 (25.07.81) B09b-01 C04b-07 C04b-29

25.12.79 as 167694 (34WB)

The solidifying agent exhibiting excellent water absorption and solidification property, and suitable for use in solidification of sludge having high water content, e.g. sewage, etc. or for consolidating weak ground etc., is described. The agent comprises cement and a mixt. of Ca sulphoaluminate and insoluble anhydrous CaSO₄-II, as solidification-enhancing agent. The wt. ratio between the former and the latter is 1/(0.2-4.0). The content of solidification-enhancing agent is 5-80 wt. %.

In an example, 500 ml waste H₂SO₄ soln. from the anode oxidn. of Al product and 650 ml waste NaOH soln. are mixed together (pH 7.0) to give non-crystalline alumina hydrate. The alumina

hydrate obtd. and CaCO₃ are mixed together and dewatered by centrifugation in admixt. with polymer coagulant, after which the reaction mixt. is pre-dried at 150 deg.C for 5 hrs. and calcined at 1,400 deg.C for 2 hrs. to give Ca sulphoaluminate (CSA). CSA is then mixed with ordinary portland cement and insoluble II anhydrous CaSO₄ II to give a sludge-solidifying agent. (4pp)

NITL ★ D15 67136 D/37 ★ J5 6095-305
Liq. filter element wound around shaft - has inner and outer membranes sealed together leaving space for interposition of intermediate layer

NITTO ELECTRIC IND KK 29.12.79-JP-172147

J01 P34 (01.08.81) A61m-01/03 B01d-13

29.12.79 as 172147 (26AS)

Filter element shaped like a sheet is described for filtering a soln. such as aq. effluent. The element is pref. assembled in a precision filter, and consists of three layers; two are membranes and the third is interposed to form a liq. passage. The element has a rectangular shape, three sides being sealed to form a sheet bag having an opening connected to a liq. feed source.

Improvement is that the element is wound around a straight shaft. The outer membrane is so sealed to the inner membrane that a space is formed to just receive the intermediate layer. Formation of wrinkles on the filtering surface of the membrane is prevented. (4pp)

KURS ★ D15 67137 D/37 ★ J5 6095-306
Cleaning filter header - for feeding liq. to bundles of hollow yarns, using cleaning flow parallel to header face perpendicular to long axis of yarns

KURARAY KK 28.12.79-JP-172485

J01 (01.08.81) B01d-13

28.12.79 as 172485 (26RH)

A method is claimed for cleaning a header for feeding a raw liquid such as dirty water into a bundle of hollow yarns, forming a filtering membrane in a form of filtering module to be assembled in a filter. The object is to completely clean the header to avoid clogging of the hollow yarns.

The novelty is as follows; a flow of cleaning liquid is applied to the header so as to flow in parallel to the header face perpendicular to the long axis of the hollow yarns, until scale is peeled off from the header face and drained outside through a drain port provided at the header. (4pp)

KURS ★ D15 67138 D/37 ★ J5 6095-307
Feeding raw liq. into filter without clogging filter or feed header - using liq. drain ports at feed header to return part of liq. to feedback line connected to tank or pump inlet.

KURARAY KK 28.12.79-JP-172486

J01 (01.08.81) B01d-13 B01j-04

28.12.79 as 172486 (26WB)

Method comprises feeding raw liq. such as dirty water into a filter such as those having hollow yarn membranes housed in tubular casings to form membrane filter modules, each having a raw liq. feed header, connected to a raw liq. tank through a pump. The drain port of each module is connected to a return line connected to the tank to form a liq. circulating path.

One or more liq. drain ports are formed at the feed header to partly return the liq. from the header to a feed back line connected to the tank or pump's inlet, continuously or intermittently. (4pp)

 Thermal softening of water used as steam-generator feed - using two-stage crystallisation of calcium sulphate at increased pressure and temp.

STAVROPOL POLY 27.04.79-SU-759454
 (30.12.80) C02f-05

7.04.79 as 759454 (29MI)

Method for the thermal softening of natural waters, principally those containing a high concentration of calcium sulphate, such as lime-containing ocean and stratal waters, and can be used for the preparation of feed water for steam generators for ordinary and petroleum industries, includes two-stage crystallisation of the calcium sulphate at increased temperature and pressure. The degree of softening is increased, in the case of make-up water for steam generation, by carrying out the second-stage crystallisation with the pressure at a value of 2-5 bar below the pressure in the steam-generator, with the steam heated to the saturation temperature; the softened water is steamed to 1.05-1.1 times and mixed with blown-through water. (3pp Dwg.No.1)

STAV = ★ D15 67627 D/37 ★ SU-791-647
 Cleaning wash-water of steam generators fired by sulphurous oil - by treating with wash water with sodium sulphate, and mixing with regeneration solution from hydrogen cation filters

STAVROPOL POLY 20.03.79-SU-737583
 (30.12.80) C02f-09

20.03.79 as 737583 (132WD)

The process comprises treatments with caustic soda and lime and separation of the deposits thus formed. To reduce the caustic usage and prevent furring-up of the generator, 40-45% of the second alkali treatment stage output water is heated to 32-35 degrees C, for mixing with sodium sulphate and then with make-up water and lime, passage through a bed of glauberite, cooling to 2-10 degrees C, passage through sodium sulphate, and treatment with caustic.

Prof. the make-up water is spent regeneration solution from hydrogen-cation filters. The treatment with lime after saturation with sodium sulphate, and the use in the two-stage cleaning of sodium-sulphate treated solution to a content of 60g/l, gives crystallisation of the sodium sulphate through decrease in its solubility.

Thus, whereas 55-60% of the water is used for washing, the remainder is treated with glauberite to give e.g. a solution with sodium sulphate 400, caustic soda 13.5, calcium sulphate 0.14 g/l, for heating to 5 degrees C. Bul.48/30.12.80.(4pp)

Desalination of sea or sewage water - by evaporation effected by spraying into low pressure environment

ATWELL G 17.05.78-GB-020135

(25.08.81) B01d-03/02

06.11.79 as 091704 (295BZ)

In a desalination system, a constant negative pressure is maintained in an evaporation chamber. Evaporated water vapour passes through the vacuum pump maintaining the negative pressure and condenses within an enclosure external to the evaporation chamber. The evaporation chamber is positioned concentrically in the enclosure which also includes a tank receiving the contaminated water for treatment. Solids may be selectively removed from the base of the evaporation chamber while maintaining the negative pressure using an air lock.

For the extraction of fresh water from a contaminated water source such as sea-water or sewage. The device is relatively efficient, economical and low cost, particularly if preheating of the incoming water can be effected e.g. using solar radiation. (4pp)

STAH ★ D15 67794 D/37 ★ US 4285-792
Self-cleaning pH meter - having electrode chamber with cleaning paddle wheel rotated by impingement of sample

STANDARD OIL CO (OHIO) 30.07.80-US-173777

J04 S03 (25.08.81) G01n-27/38

30.07.80 as 173777 (67DJ)

Self cleaning pH meter for monitoring pH in an effluent process stream comprises a sampler for the stream and an electrode chamber which receives the sample from the sampler. The electrode chamber supports a pH electrode and the chamber and electrode are automatically continuously cleaned by a rotating paddle wheel in the chamber whose rotation is induced by the impingement of the sample upon it.

The electrode chamber (14) supports an electrode (13) and contains a paddle wheel (45) carrying cleansing brushes (46). A sample of the effluent process stream is pumped through the inlet port (31) into the electrode chamber (14). It impinges upon the paddle wheel causing it to rotate and the brushes clean any oily

waste and sediment from the chamber and electrode.

Deleterious build up of oily wastes and insoluble sediments on the electrode and chamber is prevented. (6pp Dwg.No.3)

In a new process for coupling nucleic acids to carrier materials activated with cyanuric acid chloride, the carrier materials (pref. cellulose or paper) are contacted with the nucleic acid in a weakly acidic, buffered pH range (pref. pH 5-6.5).

In an example, Whatman (RTM) 540-paper (0.5 sq. cm) is shaken 15 mins in 3M NaOH and 30 mins. at room temp. in 5% cyanuric acid chloride soln. in dioxan/xylene (1:1). After washing twice with dioxan, once with dioxan/glacial acetic acid /water 2:1:1 and once with water (10 mins. each wash), the paper is coupled with nucleic acid at room temp. in m/15 soerensen buffer with a DNA conc. of 100 mcg/ml. Covalent binding is up to 20 mcg DNA/sq.cm. Inactivation of residual gps. is effected with 1% ethanolamine in coupling buffar.

Used in prodn. of immobilised nucleic acids useful in biochemistry for affinity chromatography. Chemically simple coupling procedure giving a prod. which is stable under hybridisation and elution conditions. The procedure is universally applicable, and is suitable for the coupling of DNA and RNA fragments of all sizes (single- and double-stranded). (5pp)

KRUG/★ D16 66228 D/37 ★DE 3007-143
Quickly kiln-drying green malt - by aerating in esp. impulse-type HF field pref. in two steps

KRUGER E 26.02.80-DE-007143

(03.09.81) C12c-01/04

26.02.80 as 007143 (200DH)

Green malt contg. 40-50wt.% water is kiln-dried by airing in a high frequency field of 10 MHz to 25 GHz (esp. 2-3 GHz) until malt

is formed and the water content is reduced to 3-8 wt. %.

The high energy treatment pref. takes place in impulses, with rest pauses for airing and cooling between short, high energy treatments. A 2-step process is pref., in which the water content is reduced to 10-20wt.% at 3-70 deg. C in the 1st withering or pre-drying step, and to 3-8wt.% at 75-100 deg. C in the 2nd step. High frequency can be used during both withering and kiln-drying or during kiln-drying alone. The air throughput can be 3500-7000 cu.m./t malt during withering and 500-4000 cu.m/t malt during kiln-drying.

High-frequency treatment can reduce kiln-drying time to 1/10 to 1/20 of usual time, without lowering malt quality. (10pp)

PERW/★ D16 66246 D/37 ★DE 3007-396
Farmyard manure gas fermenter - with program controlled recirculation of floats and sinks layers

PERWANGER A 27.02.80-DE-007396

P11 (03.09.81) A01c-03/02

27.02.80 as 007396 (39BZ)

A farmyard manure gas fermenter is a horizontal cylinder, made of steel, plastic, concrete, wood or combinations of them. One side wall has pipes for the gas extraction, for the supply of fresh manure and the pump connections for the sinks and floats layers. The opposite side wall has pipes for the outflow of the digested manure, for a recirculation and for the removal of extreme floats or sinks layers.

This creates a plant which can be produced at a capital cost which equals the savings of fuel oil by the gas produced. It requires little maintenance. (8pp)

Fermentation gas reactor - with revolving fluid spray pipe for floating scum layer removal

AGRO BIOGAS GMBH 04.01.80-DK-000050

(03.09.81) C02f-03 C12m-01

28.03.80 as 012198 (39RH)

A fermentation gas reactor is equipped with a special device to destroy the floating layer of scum which inhibits the gas production. The device consists of a horizontal pipe which can turn on a swivel on a vertical pipe. A pressurised liq. which is sprayed through nozzles in the horizontal pipe both revolves the spray device and breaks up the layer of scum.

This is a robust design which requires little maintenance and is suitable for continuous operation over long periods. The reactor efficiency is raised. (13pp)

ITAF★ D16 66258 D/37 ★DE 3027-929
Polysaccharide copolymer with enzymatic activity prodn. - by reacting polysaccharide suspension with enzyme and vinyl monomer

ITALFARMACO 28.02.80-IT-020213

A11 B04 (A96) (03.09.81) C12n-09/02 C12n-11/02

23.07.80 as 027929 (1251RH)

Prodn. of polysaccharide copolymer having enzymatic activity comprises treating a suspension of polysaccharide in aq. medium with a vinyl monomer (I) and an enzyme, and subsequently with a metal-salt contg. catalyst, then exposing the mixt. to UV irradiation. Pref. the catalyst is a ferric salt and (I) are of formula CH₂:CRR' or are N-acryloyl hetero- cycles. (R is H or methyl. R' is cyano or lower alkoxy carbonyl). Claimed (I) are methyl methacrylate; glycidyl methacrylate; acrylonitrile; bis-acryloylpiperazine and N,N',N-trisacryloyl-hexahydrotriazine.

The immobilised enzymes are useful in synthesis and for chemical or biological analysis. A wide range of enzymes can be immobilised with retention of their original activity on easily-prepd. matrices. Only small amts. of (I) are used and no pre-activation is necessary. (15pp)

US3950222 US3990944 4.Jnl.Ref E(FR)

Catalyst for biochemical conversion reactions comprises solid nodules of one or more polymer (at least one being crosslinked) with an enzyme covalently bound to the polymeric material. A microorganism is physically entrapped in the 3-dimensional structure of the crosslinked polymer.

The enzyme is suitably covalently bound via COOH, OH, Ph, tyrosine, NH₂ or SH gps. in the enzyme or polymer. The solid nodules may be in the form of beads of 0.1 to a few mm in dia. The polymer may be a polysaccharide such as cellulose, starch, agarose, dextran, carrageenin, alginate or chitin, or a vinyl polymer, polyaminoacid, portein, polyamide or polyurethane. Typical enzymes include oxidoreductases, transferases, hydrolases, lyases, isomerases and ligases. The microorganisms may be algae, bacteria, bacteriophages, fungi, viruses, antisera, protozoa and yeasts.

The catalyst is useful in conversions proceeding in at least 2 stages from a substrate to a desired end prod. via at least 1 intermediate, with enzyme required at one stage and microorganism in the other. Typical prods. include EtOH from cellulose, starch, lactose or xylose, BuOH from cellulose and 6-aminopenicillanic acid from a penicillium sp. fermentation. (15pp)

E(AT CH DE FR GB IT LI LU NL SE)

In a process for producing methane gas by fermentation the methane is recovered by maintaining a reduced pressure in the chamber in which the fermentation process is carried out. Pref. the pressure is between 0 and 0.5 atmospheres underpressure and is maintained e.g. by suction removal of the methane.

Process is useful in all methane prodn. units in which waste material such as water purificn. sludge, conc. waste water from biological treatment plants, domestic waste fractions, animal husbandry waste etc. is fermented. Use of reduced pressure (e.g. 1-5 m water column) give up to 50% increase in the vol. of methane produced per m³ reactor per day and also increases the degree of conversion of the fermented material to methane. Calculations show that for a given vol. of methane, the reactor vol. required can be reduced by one third, which saves investment costs for the plant. (6pp)

BEHW D16 55330 D/31 = EP --34-692
Carboxy- or hydroxy-alkyl polysaccharide derivs. - contg. detectable, esp. dye gps., useful for endohydrolase assay, pH indication etc.

BEHRINGWERKE AG 19.01.80-DE-001878

C12q-01/34 G01n-33/50

10.01.81 as 100139 (1251HM) (G) No-Citns. E(BE DE FR GB IT NL)
Polysaccharides of formula RO-(Glucose-(OR)₃n)n-OR (I) are new (n is 100-12500; R is H, 1-5C alkyl subst. by carboxy or hydroxy, or is the residue of a detectable molecule (T). The (3n+2) R gps. must include at least one subst. alkyl and are T gp.). Esp. pref. cpds. have n as 600-6000 and R are H, 1-2C subst. alkyl or T.

(I) are reagents for detection and assay of endohydrolases (esp. amylases), and also pH and oxidn. indicators, and for detecting nitrite, bilirubin and urobilinogen. (I) have good solubility in aq. and polar aprotic solvents and can be incorporated into porous carriers, then fixed simply by drying to practically water-

insoluble (but swellable) form. The resulting test papers are thus resistant to 'bleeding'. (18pp)

KRPP D16 62448 D/35 = EP --34-739
Froth formation of gas-liq. reactions - in circulation reactors controlled by side stream injector recycling

KRUPP F GMBH 12.02.80-DE-005115
J04 (02.09.81) *DE3005-115 B01d-19/02
07.02.81 as 100866 (39DH) (G) No-Citns. E(AT CH FR GB LI SE)

The formation of froth during chemical or biochemical gas-liquid reactions in circulation reactors is controlled by recycling the froth by a fluid flow from the froth zone into the liquid circulation of the reactor. The fluid flow is generated by a by-pass of the reactor liquid and/or of the gas supply to the reactor.

This saves the use of any chemical agents and saves more energy through a reduced requirement of gas for the reactor than what is needed for the pump to produce the fluid flow. (21pp)

FARH ★ D16 66320 D/37 ★ EP --34-759
Chromogenic cephalosporin cpds. for beta lactamase detection - carrying nitro-phenyl:thio-methyl gp. in the 3-position

HOECHST AG 23.02.80-DE-006889
B02 (02.09.81) C07d-501/36 C12q-01/34

11.02.81 as 100959 (280BZ) (E) No-Citns. E(BE FR GB IT NL)
New chromogenic cephalosporin derivs. are cpds. of formula (I) (where R₁ is H, formyl, opt. subst. aroyl, or an acyl residue of the formula (R') (R) (R')C-CO-; R' is H, opt. subst. 1-4C alkyl, an opt. subst. and/or mono- or polyunsatd. carbocyclic ring, opt. subst. aryl or aryloxy, or opt. subst. heteroaryl or heteroarylthio; R and R' are H, 1-4C alkyl, OH, opt. subst. acyloxy, opt. subst. alkoxy, amino, opt. subst. alkylamino, opt. subst. acylamino, alkoxycarbonyl, halogen, CN, sulphony or aminosulphonyl; and R₃ is H, NO₂, halogen, alkyl, CN, carboxy, alkoxycarbonyl or aminocarbonyl).

(I) are chromogenic beta-lactamase substrates: opening of the beta-lactam ring under the influence of beta-lactamase causes a colour shift into the visible spectrum. (I) can accordingly be used for the detection of beta-lactamases and/or in the detection of beta-lactamase inhibitors. Preparations for the detection of beta-lactamases (e.g. for use in clinical microbiology) can contain (I) in soln. or as a carrier (e.g. paper in the form of test strip). (I) can also be used in e.g. column-chromatographic purification of beta-lactamases. (22pp)

Glucose determ. - using membrane fixed with glucose oxidase and glucose isomerase and measuring concn. of oxygen or hydrogen peroxide formed

GONDO S 26.12.79-JP-173467

B04 E13 J04 (27.07.81) C12q-01 G01n-27/30

26.12.79 as 173467 (50HM)

Glucose sensor comprises fixed enzyme formed by fixing glucose oxidase and glucose isomerase, namely a fixed enzyme membrane in which glucose oxidase and glucose isomerase are fixed in the same membrane or a fixed enzyme membrane consisting of two layers fixed separately with glucose oxidase and glucose isomerase.

Glucose oxidase brings about the reaction $\text{Glucose} + \text{H}_2\text{O} + \text{O}_2 = \text{gluconic acid} + \text{H}_2\text{O}_2$. As O_2 dissolved in water decreases and H_2O_2 increases according to the concn. of glucose by the reaction, the concn. of glucose can be indirectly determined by measuring the concn. of dissolved O_2 of H_2O_2 . Carrier for fixing the enzymes is e.g. collagen.

By using glucose isomerase together with glucose oxidase, the sensitivity of the glucose sensor is raised and the deterioration of the sensitivity with time is depressed, improving the stability of the sensor. (5pp)

27.12.79 as 170926 (5AT)

Brevibacterium requiring acetic acid for growth are new.

Examples of the species are B. flavum AJ11277(FERM-P4551) (AECr, Ac-, producing L-lysine), B. flavum AJ11278 (FERM-P4552) (AECr, Hse-, Ac-, producing L-lysine, B. lactofermentum AJ11280 (FERM-P4554) (ACEr, CCLr, Ala-, Ac-, producing L-lysine), B. flavum AJ11517 (FERM-P5337) (Ac-, producing L-glutamic acid), etc. The bacterium are derived from parent strains of B. lactofermentum ATCC 13869 and B. flavum ATCC 14067. (AECr: resistible to S-(2-aminoethyl)cysteine, Hse-: requiring homoserine, Ac-: requiring acetic acid, CCLr: resistible to alpha-chlorocaprolact alpha-chlorocaprolactam, Ala-: requiring alanine). The varieties can be obtd. by treating the parent strains by conventional mutation-inducing means e.g. irradiation with UV, X-ray, radiation, treatment with mutation-inducing chemicals, etc.

Varieties obtd. can produce amino acids e.g. L-arginine, L-glutamic acid, L-histidine, L-isoleucine, L-leucine, L-methionine, L-ornithine, L-phenylalanine, L-threonine, L-valine, L-tryptophane, etc. utilising the carbon source with high efficiency. (4pp)

KAOS ★ D16 66822 D/37 ★ J5 6092-785
Cultivating microorganism using hydrocarbon deriv.) as carbon source - with addn. of glyco:lipid

KAOSOAP KK 26.12.79-JP-169901

E13 H04 (27.07.81) C12n-01/38 C12p-19/44 C12r-01/64

26.12.79 as 169901 (140AS)

In the cultivation of microorganisms, partic. yeast, using hydrocarbons or hydrocarbon derivs. as main carbon sources, the improvement comprises adding to a medium a glycolipid cpd. of formula (I). R₁ is H or CH₃; when R₁ is H, R₂ is 12-16C satd. or unsatd. hydrocarbyl gp., or when R₁ is CH₃, R₂ is 11-15C satd. or unsatd. hydrocarbyl; R is 1-20C alkyl or oleyl, pref. 1-3C alkyl.

Addn. of (I) ensures rapid incorporation of hydrocarbons or their derivs. and growth of microorganisms can be accelerated. Growth acceleration is partic. noticeable using 12-18C n-alkanes. (10pp)

KAOS ★ D16 66823 D/37 ★ J5 6092-786
Cultivation of hydrocarbon-assimilable microorganisms - in presence of hydrocarbon(s) and glyco:lipid(s) to improve uptake and growth

KAOSOAP KK 26.12.79-JP-169902

E13 H04 (27.07.81) C12n-01/38 C12p-19/44 C12r-01/64

26.12.79 as 169902 (140RH)

In the cultivation of microorganisms, partic. yeast, using hydrocarbons or hydrocarbon derivs., pref. 10-18 n-alkanes, as

main carbon sources, the improvement comprises adding to a medium a glycolipid cpd. of formula (I) (R1 and R2 are H or COCH₃; R3 is H or CH₃; R4 is 12-16C opt. unsatd. hydrocarb. when R3 is H, or 11-15C opt. unsatd. hydrocarb. when R3 is CH₃). (I) can be derived from glycolipids (sophorolipids) produced by certain types of yeast belonging to the genus *Torulopsis*.

Hydrocarbons or derivs. thereof are more advantageous than glucides because of their high contents of effective carbon per unit wt. but their rates of incorporation into microorganisms is small. By the addn. of (I), rapid incorporation of hydrocarbons or their derivs. can be attained and growth of microorganisms can be remarkably accelerated. The growth acceleration is partic. noticeable in using 10-18C n-alkanes. (8pp)

Choline oxidase - obtd. by culturing fungi of penicillium genus, useful for determ. of cholinesterase or lecithin

AMANO PHARM KK 25.12.79-JP-167519

B04 (27.07.81) C12n-09/04 C12r-01/80

25.12.79 as 167519 (69RH)

Choline oxidase may be produced by culturing choline oxidase-producing fungi of *Penicillium* genus and withdrawing choline oxidase from cultured mixt. Choline oxidase is useful as reagent for determination of cholinesterase or lecithin which are used for diagnosis of various diseases such as nephroses syndrome due to choline esterase or liver diseases (by means of choline esterase) and diagnosis of lipoheemia (by means of lecithin), choline, resultant from choline ester by choline esterase, may be oxidised by choline oxidase and yielded hydrogen peroxide may develop colour and be determined. Lecithin is treated with phospholipase D and yielded choline is determined as well as the above and amt. of lecithin is calculated.

As an example of fungi of *Penicillium* genus may be cited *Penicillium ochro-choloren* No. 79 (FERM P-No.5303) which was sepd. from soil. Other suitable fungi include *Penicillium carnescens* IFO 7955, *Penicillium janthinellum* IFO 7905, *Penicillium citrinum* IFO 6026 etc. (5pp)

AMAN ★ D16 66825 D/37 ★ J5 6092-788
Poly:amine oxidase AT-1 - prepd. by culturing *Aspergillus terreus* IFO 4346, which is an enzyme catalysing oxidative deamination of spermidine and spermine

AMANO PHARM KK 24.12.79-JP-166952

B04 (27.07.81) C12n-09/06

24.12.79 as 166952 (69BZ)

Novel microbe polyamine oxidase AT-1 has the following physicochemical properties: It acts on spermidine to give 1 mol of putrescine, 1 mol of 3-aminopropion aldehyde and 1 mol of hydrogen peroxide from 1 mol of spermidine, and also acts on spermine to give 1 mol of putrescine, 2 mols of 3-aminopropion-aldehyde and two mols of hydrogen peroxide from 1 mol of spermine.

The oxidase oxidises spermidine and spermine in a ratio of 2:1 but does not act on other amines at pH of 6.5 pref. vicinity of 45 deg.C at pH 6.5 and vicinity of 50 deg.C at pH 7.0. When treated at 30 deg.C for 30 minutes, more than 90% of residual activity is present at pH 5.2-6.5. More than 90% of residue activity is present on treatment at pH 6.5 and 30 deg.C for 10 minutes.

Max absorption spectra is in the vicinity of 375 nm and 460 nm and the substance is flavin enzyme. The oxidase is inhibited by copper and mercury ions; its isoelectric point is 5.0-5.23 and mol. wt. is 130,000 (Gel filtration) with mol.wt. of Subunits being 65,000 (SDS disc electrophoresis method). It is isolated as needle like crystal form.

Polyamide oxidase is an enzyme that acts as catalyst in oxidative deamination reaction of polyamine partic. decomposition metabolism of polyamine such as spermidine or spermine etc. in living bodies. The novel polyamine oxidase AT-1 may be produced from culture mixt. of *Aspergillus Terreus* IFO 4346 using in culture medium contg. spermidine or spermin as single carbon and nitrogen source. (9pp)

 Glutamic acid fermentative prepn. - by culturing
 evibacterium with reduced isocitrate lyase activity and
 covering L-glutamic acid from the culture medium
 AJINOMOTO KK 27.12.79-JP-170928
 B05 E16 (27.07.81) C12p-13/14 C12r-01/13
 12.79 as 170928 (5AT)

Brevibacterium with reduced isocitrate-lyase (4,1,3,1 Ls-
 isocitrate glyoxalate-lyase) activity is cultured in liq. culture
 medium and L-glutamic acid accumulated in the culture medium
 recovered.

Examples of the species used are *B. lactofermentum* AJ11516
 (FERM P-5736) (Ac-, reduced isocitrate-lyase activity) and *B.*
flavum AJ11518 (FERM-P5338) (reduced isocitrate-lyase
 activity). Those strains are derived from *B. lactofermentum*
 ATCC 13869 and *B. flavum* ATCC 14067 by common mutation-
 inducing means. The strains is cultured at 24-37 deg.C aerobically
 with pH in the range 6-9. The reduced isocitrate-lyase activity
 means that the activity of isocitrate-lyase is reduced to such a
 degree that its activity can not be detected. Ac- is a requirement
 for acetic acid.

Variety showing reduced isocitrate-lyase activity is derived
 from Known L-glutamic acid-producible strains of
 Brevibacterium and has been found to produce L-glutamic acid
 with higher yield compared with that attained by the parent
 strain. (3pp)

 Enzymatic immunoassay beta 2-micro-globulin determ. - using
 polystyrene beads sensitised with anti human beta 2-micro-
 globulin labelled with peroxidase

FUJIZOKISEIYAKU 20.11.79-JP-149576
 A96 B04 (28.07.81) G01n-33/54
 20.11.79 as 149576 (50DJ)

A method of determining beta2-microglobulin by enzymatic
 immunoassay comprises using polystyrene beads sensitised with
 anti-human beta2-microglobulin antibody and anti-human beta2-
 microglobulin antibody labelled with peroxidase, and
 determining the content of beta2-microglobulin in sample liq. by
 utilising the oxidising activity of peroxidase.

In the method beta2-microglobulin antigen is held between the
 polystyrene beads sensitised with anti-human beta2-
 microglobulin antibody and the anti-human beta2-microglobulin
 antibody labelled with peroxidase, and the content of beta2-
 microglobulin in sample liq. is determined by utilising the
 oxidising activity of peroxidase, i.e. the method is enzymatic
 immunoassay called sandwich process.

According to the method, beta2-microglobulin in small amt. in
 sample liq. (e.g. blood, urine, etc.) can be determined in 5-6 hrs.
 by relatively simple operation without using expensive appts.

07.07.79 as 086086 (52HM)

Prodn. of DNA-relaxing enzyme comprises culturing a DNA-

relaxing enzyme producing strain of *Haemophilus*, and treating the resultant organism by ultrasonication, then fractionation with ammonium sulphate for pptn., phosphocellulose chromatography, DEAE-cellulose chromatography, and gel filtration. The enzyme specifically acts on cyclic double-stranded DNA and relaxes the torsion structure.

The strain of *Haemophilus* means *H.gallinarum* ATCC 14385 and its natural or artificial variant. The enzyme has the following properties: 1) relaxing of the torsion of DNA; 2) optimum pH: 7-8; 3) optimum temp.: 35-42 deg.C (partic. 37 deg.C); 4) mol.wt. about 110 power 5 (determined by gel filtration with Sephadex G-200).

The enzyme is used in cut and recombination of a single linkage of double-stranded DNA. Since sensitive to ethidium bromide bound to double-stranded DNA or to some bond of specific antibiotics, the enzyme is useful as a biochemical reagent used in research of new antibiotics. (J56011792) (5pp)

MITN D16 81134 C/46 = J8 1035-42

Microwave distillation of beer in multistage apparatus - with counter flow of beer and alcohol vapour

AGROHOL SYSTEMS 30.06.80-US-164250

(25.08.81) B01d-03/16 C07c-31/08

30.06.80 as 164250 (295BZ)

Beer flows through a series of evaporators and then through a set of salvage cells. Each of the evaporators and salvage cells is heated by a microwave unit which evaporates alcohol. Alcohol from the evaporator stages is passed upstream to the first stage into which is also added condensed vapour from the salvage cells. Vapour from this first cell is condensed to yield a product comprising 95% alcohol and 5% water. Preferably the beer feed supplied to the first stage is preheated.

The apparatus extracts alcohol from beer. Use of the salvage cells recovers alcohol from the waste of the evaporator stages. (4pp)

Polysaccharide antigen from *Pseudomonas aeruginosa* slime - useful for inducing immune response in subjects

US SEC OF THE ARMY 10.12.79-US-101620

B04 (25.08.81) A61k-31/70 A61k-39/10 C08b-37

10.12.79 as 101620 (1248KB)

Isolation of polysaccharide antigen (I) from the crude slime of *Pseudomonas aeruginosa* involves first adding 1% by vol. 10% cetyltrimethylammonium bromide soln., allowing the mixt. to stand for 30 mins. and then centrifuging to remove pptd. nucleic acids, adding 80% by vol. of 95% EtOH and collecting the resulting ppte. by centrifuging, and dissolving the ppte. in phosphate buffered saline.

The soln. was treated just as for the original slime to give a second ppte., which is subjected to acetic acid hydrolysis and heated at 90 deg.C for 18 hrs. then cooled to room temp. and centrifuged. The residual lipid polysaccharides, together with material recovered by CHCl₃ extrn. of the supernatant, are subjected to alcoholysis then centrifuged. The solid polysaccharides are recovered, dissolved in phosphate buffered saline, digested with nucleases to remove nucleic acids and extrd. with PhOH to remove proteins.

The polysaccharide prod. is kept at 4 deg.C for 12 hrs. and centrifuged, and the aq. layer is sepd. and subjected to alcoholysis to ppte. polysaccharides. This ppte. is sepd. by centrifuging and dissolved in phosphate buffered saline then applied to a 2.6 times 100 cm column of Sephadex G-100 (R.T.M.) equilibrated in the saline. The void vol. fractions are combined and subjected to alcoholysis to ppte. polysaccharides. The ppte. is dissolved in water and desalted on a 1.5 times 60 cm column of Sephadex G-50 equilibrated with distilled water or phosphate buffered saline at pH7.2 to isolate a prod. of molecular wt. 100000-300000 daltons. The (I) is a high molecular wt. and non-toxic and non-pyrogenic prod. that is highly effective in inducing an immune response in the host. (7pp)

20.04.79 as 031754 (931AT)

An amino acid is produced by a submerged cultivation of an amino acid-producing microorganism in a nutrient medium. The medium comprises nitrogen, mineral salts and a mixt. of hexose and pentose monosaccharides.

The monosaccharides are obtd. by percolation hydrolysis of cellulose-contg. plant raw materials which are purified to remove furfural, and contg. oxymethyl furfural and lignogummin substances in amt. 1-3 wt.% w.r.t. monosaccharides.

The prepn. uses an abundant, cheap carbon source, has a reduced number of prodn. steps and yields an end prod. of improved quality. (5pp)

CORG ★ D16 67908 D/37 ★ US 4286-061
Continuous cultivation of microbes - in plug flow reactor contg. microbes immobilised on porous support with controlled pore size

CORNING GLASS WORKS 23.06.80-US-162582 (05.09.78-US-939190)

B04 (25.08.81) C12n-11/14
23.06.80 as 162582 (1248HM)

Continuous cultivation of microbes in a plug flow reactor contg. the microbes immobilised on a porous inorganic support involves supplying nutrient medium at a rate sufficient to maintain them in a logarithmic growth state, while removing effluent contg. the microbes at an equal rate.

The microbes are bacteria, yeasts and fungus-like organisms, and the reactor is operated continuously in a plug flow mode with the immobilised microbes covered by the medium. The porous support has a controlled porosity such that at least 70% of the pores, on a pore size distribution basis, have a pore dia. that is (a) for bacteria, at least as large as the smallest major dimension of the bacteria but less than 5 times the largest major dimension; (b) for yeasts, similarly but up to 4 times; and (c) for fungi, similarly but up to 16 times.

The procedure is not subject to wash-out, and in the culturing process maximum specific growth rates can be achieved. (9pp)

STEK/ D16 41733 C/24 = US 4286-062
Hyaluronidase-contg. compsn. for accelerating meat-ripening - is prepd. from comminuted animal testicles treated with albumen material (NL 27.5.80)

STEKOLNIKOV LI (MEAT) 22.11.78-SU-687905
(25.08.81) *DE2945-970 C12n-09/96

14.11.79 as 094325 (931JB)

An enzyme meat tenderising agent is produced by comminuting the testes of slaughtered animals; extracting with an amt. of acidulated water to a pH of 4.5-4.7; and separating an aq. soln. contg. hyaluronidase from the mixt. obtd.

An albumin-contg. substance is then added to the soln., such that the ratio of the substances to the testes is 0.04-1.6:10-15. A suspension is formed, which is then subjected to concn. by evapn. at 25 deg.C or less. A concentrate of the prod. is obtd., which is then dried.

The prod. is stable upon storage. Further purification may be achieved by filtering the concentrate before drying. (3pp)

A96 B04 (25.08.81) *WP8101-242 + C12n-09/50
05.11.79 as 091041 (945JB)

Process is for isolating a prod. from crude bromelain (I) useful in debriding devitalised tissue in mammals. Crude (I) is suspended in a buffer soln. of pH 8-10.5 to selectively solubilise the active components. Undissolved solids are sepd., then a portion of molecules of mol. wt. 10,000 or less are removed from the soln.

Opt. water insol. prods. formed in the preceding purificn. step are removed, and the soln. is concd., sterilised and lyophilised.

Suitably the buffer comprises Na borate and has pH 8.0-9.5. Sepn. of small molecules may be by dialysis against water.

High yields of a prod. with superior debridging activity are obtd. (5pp)

KALU/ ★ D16 67909 D/37 ★ US 4286-065
Microorganism cultivation on granular material - in tower with spaced stages with blades advancing material to next stage
KALUNIANTS K A 19.11.79-US-095667
(25.08.81) C12m-01/06
19.11.79 as 095667 (295AT)

Granular nutrient material is introduced at the top of a tower and enters the uppermost stage. This stage comprises a disc base plate on which an open-ended cylinder rests to retain the nutrient material. After a growth period, the cylinder is raised and the material is moved radially outwards to fall past the edge of the disc. The falling material enters the second stage which is of similar construction except that it is assembled on an annular base. The second stage discharges radially inwards through an axial aperture.

Scraper fingers extend from a central shaft which passes through all the stages. Rotation of the shaft causes the fingers to sweep over the base plates and advance the nutrient into the subsequent stage. The apparatus accepts waste from an animal-breeding farm and induces the growth of mycelia or bacteria under aerobic conditions to form a fertilizer.

The appts. accepts material on an intermittent basis. The

scraper fingers can be activated selectively to prevent excess working of the nutrient medium during light loads. (9pp)

BUTL/ ★ D16 67910 D/37 ★ US 4286
Continuous conversion of starch to sugar and fermentation - 1 distn. with power from internal combustion engine
BUTLER R S 24.06.80-US-162660
(25.08.81) C12m-01/02
24.06.80 as 162660 (295AT)

A moist, particulate feed contg. a starch is delivered from hopper into an auger. Starch is converted to sugar in the auger under the influence of a hot jacket and the resultant product discharged into a fermentation vessel. A fermented liquor continuously removed from the vessel and the solids component before feeding the remainder to a distn. column.

The appts. is powered by an internal combustion engine whose exhaust gas is used to heat the auger jacket. A section of auger is in a heat-exchange relationship with the distn. column. Pref, additional heat for distn. is provided by solar energy.

The appts. produces ethyl alcohol by a continuous process. (5pp)

 23.10.80 as 200045 Div ex 4250338 (513DJ)

The aroma or taste of a smoking tobacco is augmented or
 enhanced by incorporating an effective amt. of at least one
 tri:cyclic ketone of formula (I) in which R₁, R₂ and R₃ (same or
 different) are H or 1-3C alkyl. The (I) are claimed as new in
 parent specification US4250338 (15576 D/09) and impart a sweet,
 floral, woody, spicy, leathery and/or amber aroma and taste to
 tobacco compsn.

The (I) are made e.g. by reacting (II) with (III) and treating with
 proton acid and heating. The (I) may be incorporated e.g. into a
 cigarette paper, a filter or the tobacco. (26pp)

Leather cleaning and preserving compsns. comprise (a) 30-50 pts. wt. of neatsfoot oil, lard oil or a synthetic or petroleum oil having the same non-drying characteristics as these; (b) 20-30 pts.wt. olive, peanut, almond, hazelnut or peach-kernel oil; (c) 10-20 pts.wt. beef tallow, bone fat or mutton tallow; (d) 5-10 pts.wt. beeswax, spermaceti, carnauba, candelilla or wool fat; and (e) 5-10 pts.wt. paraffin wax.

Component (a) is pref. neatsfoot oil; (b) is pref. a mixt. of olive and peanut oil; and (c) is pref. beef tallow.

The compsns. are easy to apply, are rapidly absorbed, and impart long life to leather goods. (3pp)

SETO-★ D18 67744 D/37 ★US 4285-689
Tanning compsns. contg. poly:aldehyde-amine reaction prod. - for increasing hide shrinkage temp.

SETON CO 26.06.79-US-052149

E19 (25.08.81) C14c-03/06

26.06.79 as 052149 (367AT)

Leather tanning compsns. contain the reaction prod. (I) of a polyaldehydic cpd. (II) and a sec. amine (III) in an amt. sufficient to increase the shrinkage temp. of the hide.

Also claimed are compsns. contg. cpds. of formula (Ia)-(where z is greater than 1; Y is a polyvalent hydrocarbon residue; R1 and R2 are alkylene; X1 and X2 are H or OH; a is O or I).

(II) is pref. a dialdetryde of formula $\text{OHC}(\text{CH}_2)_x\text{CHO}$ (where x is 0-4), esp. glutaraldehyde (IIa). (III) is pref. a water-soluble amine of formula X1-R1-NH-R2-X2 , esp. diethanolamine (IIIa) or methylethanolamine. The compsns. are pref. aq. solns. with a pH of less than 7 and are used for pretanning at 70-80 deg.C, using (I) in an amt. of at least 1 wt.% based on the limed wt. of the hide. This is pref. followed by chrome tanning with not more than 1.4 wt.% Cr2O3 equiv.

The compsns. are esp. useful for pretanning, allowing less Cr to be used in subsequent chrome tanning. (7pp)

 Micronised dehydrated marine mud - useful for treating skin and
 muscular, articular and rheumatic disorders
AUBERT P 05.02.80-FR-002506
 A96 (D22) (07.08.81) A61k-35
 05.02.80 as 002506 (520HM)
 Micronised powder prepd. from marine mud, e.g. that from salt
 marshes, in prepd. by the following process. The mud is spread
 out as a thin layer on trays in a ventilated oven and heated at 40-
 45 deg.C to dry. It is then crushed and powdered. The resultant
 powder has the negative ionic charge of the mud, its organic and
 mineral base elements, trace elements, and its soluble proteins.
 In cosmetology, as a cream or mask, it acts against ageing of the
 skin and has an antiwrinkle effect. In balneotherapy, after addn.

to water which may be hot, it aids functional reeducation and the
 maintenance of general plasmatic tonus. In pharmaceutical
 specialities as a poultice it may be used to treat muscular,
 articular, or rheumatic disorders, or as an ointment to treat skin
 disorders. (7pp)

 05.05.78 as 018067 (926PW)

Magnetic alloy is described which is useful in a laboratory for
 experimental purposes or for use by dentists or dental
 technicians. The alloy contains in % wt., at least 35 Pd; 0-79 Co; 0-
 80 Ni; 0-15 Cr; 0-30 Fe; 0-20 Cu; 0-3 Zn; 0-3Sn; 0-20 Pt; 0-30 Au; 0-3
 Ag; 0-3 Cd; 0-10 A-; 0-16.4 Mn, together with incidental ingredients
 and impurities. The alloy contains at least one of Co and Ni.

The alloy pref. contains 29-80 (15-56.5) Ni and 20-70 (7-57) Co. The
 m.pt. is pref. not more than 1350 deg.C and the alloy has a
 magnetic flux density B 100 of at least 2000 G in a magnetic field
 of 100 G.

Alloy has good corrosion resistance and is satisfactory for
 porcelain coating. (6pp)

SUNZ ★ D21 66757 D/37 ★J5 6092-208
 Skin-whitening compsn. - comprises refined extract of
 umbellales

SUN STAR HAMIGAKI K 27.12.79-JP-170614
 (25.07.81) A61k-07
 27.12.79 as 170614 (5RH)

Compsn. for skin-whitening use contains at least one kind of the
 refined extract of crude drugs which is obtained by (1) extracting
 at least one kind of crude drugs selected from (a) dokkatsu, (b)
 kyohkatsu, (c) senkyuh (Cnidii Rhizoma), (d) byakushi, (e)
 tohki(Angelicae Radix), (f) bohhu, (g) hamabohfu, (h) kohhon, (i)
 zenko, (j) saiko(Bupleuri Radix), (k) zukuzuishi and (l) toshishi,
 with hydrous alcohol, (2) if necessary, suspending thus obtained
 crude extract in water and (3) extracting it with hydrophobic
 polar solvent selected from ether, ester, ketone and alcohol. It is
 desirable to wash the extract with hydrophobic nonpolar solvent
 selected from aliphatic hydrocarbon, aromatic hydrocarbon and
 halo-hydrocarbon before or after extracting the crude extract
 with polar solvent.

The inventor had found that the extract of some crude drugs of
 Umbellales showed excellent beautifying and whitening effect on
 skin. The refined extract shows better effect than crude extract
 and that by washing the extract with hydrophobic nonpolar
 solvent, the effect of the refined extract can be further increased.

AGRO- ★ D22 66090 D/37 ★ BE -888-592
Conveyor for continuous can steriliser, esp. hydrostatic - has pockets fixed rigidly between side chains for less maintenance and smaller track turn radii

AGROBER MEZOGAZDAS 29.04.80-HU-001060
Q31 Q35 (17.08.81) B65b B65g

28.04.81 as 888592 (448RH)

An internal conveyor for a continuous steriliser of canned prods. The conveyor is of the type which has two side chains between which transverse carrier pockets are rigidly fixed to end brackets attached to corresp. points of opposed chains. The steriliser is of the type, e.g. hydrostatic, in which the conveyor tracks vertically up and down via 180 deg. turns.

Each end bracket is now rigidly fixed to two successive link pins of its side chain, so that each pocket retains its relative disposition to the side chains despite changes in direction of the conveyor. Pref. each bracket is removably attached to its link pins.

Each pocket is pref. tubular and made up of two parts, i.e. an exterior tubular section, fixed to the brackets and having a longitudinal access port, and an interior, coaxial rotary shutter panel to close the port and retain cans in the pocket. The shutter panel is pref. easily renewable in the exterior section of the pocket. Each pocket is pref. of circular cross-section and made of perforated metal.

By fixing the bracket to two successive link pins, the pivotal suspension bearings which require special lubrication, and bracket track guides are obviated. Initial cost and maintenance problems are greatly reduced. The minimum radius of conveyor U-turns can be cut down considerably. A more compact steriliser can be employed for a given throughput. The conveyor can be economically installed in an existing steriliser without major modifications. (20pp)

Water-absorbing material - comprising copolymer of water-insoluble unsatd. carboxylic acid, metal salt of acid and water insoluble unsatd. and multifunctional monomers

NIPPON KAYAKU KK 27.12.79-JP-169441

A96 P21 P34 (A14 A97) (25.07.81) A41b-13/02 A611-15 B01j-20/26 C09k-17

27.12.79 as 169441 (51HM)

Water absorbing material used in medical, food or horticultural industries consists of a copolymer of (A), (B), (C) and opt. (D). (A) is a water-insol. unsatd. carboxylic acid, e.g. (meth)acrylic, maleic, fumaric, itaconic, or crotonic acid; (B) is a monovalent metal salt of the carboxylic acid e.g. a Na, K or Li salt; (C) is a water-insol. unsatd. monomer e.g. styrenesulphonic acid, N-pyrrolidone, (meth)acrylamide, or N,N-diethyl(meth)acrylamide; (D) is an oil soluble and non-hydrolysable multifunctional monomer or prepolymer, e.g. divinyl monomer, polyvinyl monomer, divinyl benzene, 1,2-polybutadiene, 1,4-polybutadiene, diarylmonomethyl amine, or triarylamine.

The salt (B) is used in amt. 50-20 mol.% on total amt. of (A) and (C). The monomer or prepolymer (D) is used in amt. 10,000-1 ppm on total amt. of (A), (B) and (C). (7pp)

Eugenol isomers sepn. from mixts. by multistage vacuum rectification - provides increased yield by initial azeotropic vacuum-rectification with ethylene-glycol for prodn. of ortho-eugenol enriched fraction

KALUGA PERFUMES RES 10.05.78-SU-613546

B05 E14 (25.12.80) C07c-41/58 C07c-43/20

10.05.78 as 613546 (114GW)

Sepn. of eugenol isomers (used in perfumery and drug industry) from mixt. contg. guaiacol, 2-methoxy-3-allylphenol, o-eugenol, eugenol and chavibetal by multistage vacuum-rectification increases yield of prods. by initial azeotropic vacuum-rectification with ethyleneglycol and washing the first fraction (enriched with o-eugenol) before vacuum-rectification. The proposed method allows almost complete removal of o-eugenol from isomeric mixt. (5pp)

AECH = ★ D23 67362 D/37 ★ SU -789-492
Terpene and sesqui-terpene aldehyde cpds. purificn. - by fractionation in presence of triethanol ammonium carboxylate used as fragrant agents and intermediates

ASESTCHEM INST 19.06.78-SU-657204

B05 E15 (23.12.80) C07c-45/86 C07c-47/21

19.06.78 as 657204 (938GW)

Terpene or sesqui-terpene aldehydes are used as intermediates in fine organic synthesis or as fragrant agents. These cpds. are purified by fractional distillation in the presence of organic acid quaternary ammonium salts.

The final prod. purity is increased by conducting the fractionation in the presence of 0.5-5 wt.% of 1-20C carboxylic acid triethanol-ammonium salts, e.g. triethanol-ammonium myristate. The addn. of quaternary ammonium salts prevents formation of isomeric by-prods., which reduce the quality of the above fragrant agents. Bul. 47/23.12.80. (2pp)

Residual vegetable oil recovery from spent bleaching clay - by forming particles with organic binder and plastic clay, then solvent extrn.

ORTHO PHARM CORP 11.08.80-US-176990

(25.08.81) B01j-20/30 C11b-13/04

11.08.80 as 176990 (955RH)

Residual vegetable oil is recovered from spent bleaching clay by mixing the clay with an organic binder, water and a plastic clay, forming the mixt. into shaped particles, and extracting the oil with a suitable solvent.

The particles remain intact and do not release clay fines which are impossible to filter from the extract. The particles after oil removal can be heated to yield a carbon clay mixt. useful as an adsorbent, filter aid or for water treatment or oil purificn.

Suitable binders are starches, gums, cellulose derivs. or alginates. The plastic clay is e.g. attapulugus clay or spent clays from tin mining. The compsn. pref. contains 0.2-5 wt.% organic binder, 5-20 wt.% plastic clay, 10-25 wt.% water and the balance spent bleaching clay. (4pp)

abric conditioning prods. comprise an ethoxylated fatty acid (I) dispersed throughout the cross section of an open-celled foam substrate. The substrate is pref. a polyurethane (esp. polyester-urethane) foam with a thickness of 1.5-2.0 mm. (I) is pref. an ethoxylated 13-20 C satd. fatty acid (esp. stearic) with a molecular wt. of 1,000-2,000 and a m.pt. of 37-53 deg.C. The prod. are pref. produced by impregnating the foam with 2-5 times its wt. of (I) and then cooling.
 The prods. release (I) at a controlled uniform rate when exposed to heat in a dryer, thus reducing the risk of fabric staining. (4pp)

ENG ★ D25 66705 D/37 ★J5 6092-113
 fine powder zeolite prodn. - by mixing alkali-soluble silica, aluminium cpd. and sodium hydroxide, adjusting concn. of slurry and excess alkali ratio and powdering gel
CENTRAL GLASS KK 25.12.79-JP-167661
E33 (25.07.81) C01b-33/28
 5.12.79 as 167661 (42HM)

alkali-soluble silica (I), Al cpd. (II) and NaOH (III) are mixed with adjustment of the conc. (IV) of the prepd. slurry to 23-30% and excess alkali ratio (V) to 1.5-2.5, and the formed gel is shattered into small particles. Thus, fine powder of zeolite (VI) is produced.
 (IV) and (V) are defined as conc. of slurry is mol of SiO₂/2 x 347 100/total solid wt.; and excess alkali ratio is (Na₂O-mol/2SiO₂-mol)-1. (I) is Na silicate, silica gel, silica sol, silicic acid, est. (II) is aluminate, activated alumina, gamma-alumina, Al hydroxide etc.

Fine-powdery (VI) of particle size smaller than 1 micron is produced. The prod. (VI), is used as a builder to be mixed in detergents.

In an example, Na aluminate 109g, Na silicate 106g, (III) 46 g and H₂O 90g were mixed at 70 deg.C and the mixt. was agitated vigorously. Then the gel was allowed to crystallise at 70 deg.C for 5 hrs. After sepn. of the mother liquor, the solid was washed with pure water and dried, to obtain 92 g of (VI) of particle size 0.5-0.8 microns. (6pp)

UBEI ★ D25 66892 D/37 ★J5 6092-999
 liq. detergent for kitchen use - comprises di:ester of succinic acid, anionic surfactant, non:ionic surfactant and water
UBE INDUSTRIES KK 27.12.79-JP-169294
A97 C03 (28.07.81) C11d-03/20
 27.12.79 as 169294 (15AT)

The liq. detergent comprises a compsn. consisting of 1 to 20 wt.% di:ester of succinic acid, 5 to 30 wt.% anionic surfactant, 1 to 20 wt.% nonionic surfactant and 60 to 90 wt. % water.

Diester of succinic acid has formula

$\text{ROCOCH}_2\text{CH}_2\text{COOR}$

where R is 1-20C alkyl, alkenyl, cycloalkyl, aryl or hydroxy alkyl. Pref. it is di-butyl di-propyl, di-amyl, di-hexyl, di-heptyl, di-octyl, di-decyl, di-dodecyl, di-cyclohexyl, di-allyl, di-phenyl or ethylene-glycol esters of succinic acid. The anionic surfactant is alkyl-aryl-sulphonate salt, alkyl-sulphonate salt, (alpha)-olefine sulphonate salt, polyoxy-ethylene-alkyl-ether sulphate ester, alkylsulphate ester or fatty acid-amidosulphonate salt. The

nonionic surfactant is polyoxy.ethylene.alkyl-ether polyoxy.ethylene.alkyl.aryl- ether, fatty acid ester of polyoxy.ethylene, fatty acid ester of cane sugar or block polymer of polyoxyethylene-polyoxypropylene.

The diester of succinic acid has a fungicidal effect on fungi and bacteria. (5pp)

 Detergent compsn. for removing soap scale - comprising fatty acid obtd. from animal or vegetable oil or fat, with its corresp. ester

LION FAT & OIL KK 04.11.75-JP-131426

E17 (19.08.81) *J52056-107 C11d-07/26

04.11.75 as 131426 (126RH)

Proportion of fatty acid ester obtd. by esterification of animal or vegetable fat (or oil) to fatty acid obtd. from animal or vegetable fat (or oil) is 20:80-80:20 by wt. The fatty acid ester is methyl ester of beef tallow, coconut oil, or palm oil etc. The fatty acid is beef tallow, coconut oil, or palm oil.

The compsn. is suitable to remove the scale of soap generated in appts. for preparing soap, partic. on the inside wall of heat exchanger tubes. The compsn. is heated at e.g. 100-130 deg.C and is allowed to pass through the heat exchanger tube at ca. 50-1 m/sec. for 0.5-1 hr. The scale is easily stripped off the wall. No flaws are generated. After treatment, the detergent remaining on the wall is washed with steam and water. The compsn. which has been once used may be reused by recirculation. (J52056107) (2pp)

DAIC D25 88402 A/49 = J8 1035-718
 Granular whitener used in bleaches - contains antioxidative blue pigment, base and surfactant having aromatic sulphonate radical

DAINICHISEIKA COLOR CHEM 06.04.77-JP-038456

E19 (E24) (19.08.81) *J53124-182 + C11d-07/54

06.04.77 as 038456 (42AS)

Additive (I) consists of anti-oxidative blue pigment (III), base (IV) and surfactant (V) having aromatic sulphonate radical or its metal salt radical. As examples of (V), prod. of condensn. of naphthalene sulphonate with form aldehyde, propyl naphthalene sulphonate, butyl naphthalene sulphonate, dialkyl sulphonate, sulphonated polyester are listed. As (III), phthalocyanine blue, ultramarine blue, alkali blue lake, indigo etc. can be used. Examples of (IV) are Na tripolyphosphate, NaCO₃ and Na₂SO₄. The contents of (III) and (V) in (I) should be 0.1-30 wt.% e.g. (1-15

wt.%), and 1-10 wt.% e.g. (8-7 wt.%), respectively. The dia. of the granule of (I) is 8-60 mesh.

When cloths are soaked in a soln. of bleach contg. (I), it can be bleached and coloured slightly in blue, resulting in that it appears brightly white. By mixing of granules of (III) and (V), the change of the quality of (III) by the reaction with bleach can be prevented. (J53124182) (3pp)

ABGE = ★ D25 87286 D/37 ★ SU-789-391
Hydrated ammonium tri:poly-phosphate peroxy-hydrate - is useful as detergent and bleaching agent and is prepd. by reacting ammonium tri:poly-phosphate mono:hydrate with hydrogen peroxide

AS BELO GEN INORG 14.11.78-SU-684526

E35 (23.12.80) C01b-25/40

15.11.78 as 684526 (1511GW)

Ammonium tripolyphosphate peroxyhydrate hydrate (I) is used as a component of detergents and bleaching agents in the textile industry. The prod. is superior to the known Na and K tripolyphosphates, since it is obtd. directly as a crystalline cpd., is less hygroscopic, and obviates the necessary drying in vacuo or over P₂O₅. (I) is obtd. by reacting chromatographically pure ammonium tripolyphosphate monohydrate with 80-90% H₂O₂ in 1:9-1:11 ratio, over 1.5-2.5h at 0-3 deg.C., followed by pptn. of the prod. with EtOH or acetone, yielding crystals in 2-3 min.

The yield is maximised by secondary pptn. The cpd. is filtered and dried for 5-10h. Results of paper or TL chromatography, X-ray and chemical analysis, and ir spectroscopy gave 15.3% H₂O₂, 20% NH₃, 21.7% P, and 4.8% H₂O, confirming the (NH₄)₅ P₃O₁₀ 2H₂O₂ H₂O formula. (2pp)

Arrangement of Abstracts

'MAJOR' COUNTRIES – An alerting abstract of every basic document is provided, and of examined equivalents from West Germany, Great Britain, Japan, the Netherlands and the United States, and granted and unexamined European and unexamined PCT equivalents. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry	F	Textiles, Paper, Cellulose
AE	Polymer & General Chemistry	G	Printing, Coating, Photographic Chemistry
A+	Polymer Applns.	H	Petroleum
B	Pharmaceuticals	J	Chemical Engineering
C	Agricultural Chemistry	K	Nucleonics, Explosives, Protection
D	Food, Disinfectants, Detergents	L	Refractories, Ceramics
E	General Chemistry	M	Metallurgy
E+	General Chemistry Applns.		

Typical Abstract Heading

See CPI/WPI Instruction Manual No. 1A for explanation of the various flagged descriptors.

Copies of Specifications may be ordered from our PATENTS SUPPLY DIVISION.

NOTE TO SUBSCRIBERS

West German New Law Patentschriften are now being issued and will appear in this (D38) and future Derwent publication weeks. They have the country code DS and their number range overlaps that for the Auslegeschriften. Patentschriften (distinguished by PS at the end of the abstract) and Auslegeschriften (distinguished by DS at the end of the abstract) will appear together in numerical order, irrespective of their status.

Auslegeschriften which are based on granted EP specifications have neither DS nor PS at the end of the abstract. They are distinguished by their number range e.g. DS 286----, DS 296----, and by "Based on EPG-----" which appears immediately after the local filing information.

D11: BAKING

DEC 1981

A/★ D11 D/38 ★CS 8009-604
 o-thermal, conveyor-type bread oven heater
ERABEK V 31.12.80-CS-009604
 (0.06.81) A21b-01/14

R- D11 28843 A/16 =GB 1597-980
 hine for grooving automatically the tops of unbaked loaves -
 high speed blades cutting across loaves on conveyor to oven
OFRAPAIN LYON 04.10.77-FR-029735
 (6.09.81) *BE-861-674 A21c-11/12
 (2.77 as 052917 (006HM))

ad-making appts. includes notch-cutting units which operate
 ultaneously upon respective loaves advancing side-by-side on
 nveyor. Each unit has a knife which is moved along an
 ative path lengthwise of the conveyor to cut a loaf, and is
 rned along an offset parallel inoperative path.
 ecifically each cutter knife is on an endless chain with a
 om-run operative path, and a top-run inoperative return path
 h includes a knife-wetting felt. (8pp)

IO-★ D11 68433 D/38 ★GB 2070-908
 -docked fried dough crusts prodn. - by control of partial
 mination during frying with two mesh conveyor belts
ENO'S INC 04.03.80-US-127238
 (16.09.81) A21b-05/08
 (2.81 as 005916 (478HM))

-docked fried dough crusts are prepd. as follows: (a) a dough
 repd. contg. one or more leavening agents(I) but is handled so
 o minimise premature leavening reaction; (b) the dough is
 eted and cut into imperforate crust-sized pieces; (c) the
 erforate pieces are confined between reticular forms of a
 sh size to limit delamination and cooked in hot oil; (d) the
 sts are removed from the hot oil and rapidly cooled but are
 confined until the internal and external gas pressures
 ome equalised.

tep (a) (I) include time-responsive (pref. yeast) and H₂O-
 onspive (e.g. baking powder) agents. To prevent premature
 vening, dough is pref. kept at 80-90 deg.F prior to proofing, and
 10-160 deg.F/relative humidity 90-100% in a steam chamber
 ing proofing (to dough temp. 100 deg.F; vol. increased by
). A suitable dough contains 61% flour, 33% H₂O, 2.5% yeast,
 a total of 3.5% of salt, oil, chemical-(I) and conditioners.
 ethod affords a crust that has increased vol. for visual and
 e appeal, a relatively greaseless, crispy but tender texture,
 a fried flavour. The prod. is suitable for topping, freezing etc.
 timately for use e.g. as a pizza. (14pp)

KU/★ D11 68765 D/38 ★J5 6096-670
 ditive for improving taste and nutritive quality of boiled rice -
 nprises purified rice bran oil, beta cyclodextrin, edible
 tritin, vitamin/E and and water
FUKUMOTO S 28.12.79-JP-171968
 (04.08.81) A231-01/10
 (12.79 as 171968 (42WB))

ditive (I) is composed of purified rice bran-oil (II), beta-
 lodextrin (III), edible dextrin (IV), natural vitamin E (V) and
 ter (VI). Rice is mixed with (I) and then tempered.
 Pref. (I) is composed of 40% (II), 6% (III), 20% (IV), 1.2% (V) and
 8% (VI). (I) is diluted with water contg. enzyme and/or calcium
 , and then mixed with rice, so that the enzyme digests part of
 rice starch and the calcium ion is contained in rice as
 trition. The rice mixed with (I) is easily boiled, without being
 aked in water for 30 mins. - 1 hr. as usual.
 The addn. of (I) to rice before boiling makes the boiled rice rich
 flavour and nutrients, and improves its texture. (3pp)

ME=★ D11 69536 D/38 ★SU-793-750
 ng-loaf cutting device - has additional disc cutters and floating
 nders for sepg. loaves
MINSK MEAT DAIRY 11.03.79-SU-737133
 P62 (D12) (07.01.81) B26d-04/28
 (03.79 as 737133 (822GW))
 e device can be used for cutting bread loaves and in the prodn.
 minced meat prods. It comprises a rotating hopper with
 npartments (2) for the loaves, support platform (3) in the form
